1 Overview

PolarDB is a next-generation cloud-based service developed by Alibaba Cloud for relational databases, which is compatible with MySQL, PostgreSQL, and Oracle. Based on a distributed storage architecture, PolarDB provides high-capacity, low-latency online transaction processing (OLTP) services, and cost-effective scalable services.

Basic concepts

Cluster

A PolarDB cluster contains one primary instance and up to 15 read-only instances (at least one read-only instance must be provided to guarantee active-active high availabili ty support). A PolarDB cluster ID starts with pc, which stands for PolarDB cluster.

Instance

An instance is an independent database server in which you can create and manage multiple databases. An instance ID starts with pi, which stands for PolarDB instance.

Database

A database is a logical unit created in an instance. The name of each PolarDB database under the same instance must be unique.

Region and zone

Each region is a separate geographic area. Zones are distinct locations within a region that operate on independent power grids and networks. For more information, see Alibaba Cloud's Global Infrastructure.

Console

Alibaba Cloud offers a web-based and easy-to-use console where you can manage various products and services including PolarDB. In the console, you can create, access, and configure your PolarDB database.

For more information about the console layout, see Alibaba Cloud console.

PolarRDB console.

2 Apsara PolarDB-P release notes

This topic lists and describes all the newly released features of Apsara PolarDB-P.

The following table lists the native PostgreSQL version corresponding to Apsara PolarDB-P.

Apsara PolarDB-P version	Native PostgreSQL version
V1.1.0	11.2

V1.1.0

Feature	Description
Built-in view	The polar_stat_activity view is optimized, and columns wait_info and wait_time are added. Column wait_info displays the object that the current process is waiting for, and column wait_time displays the amount of time that the process needs to wait. If the object is a process , the process identifier (PID) is displayed. If the object is a file, the file descriptor (FD) is displayed.
Extensions	 The polar_concurrency_control extension is added to set a concurrency limit on transaction executions, SQL queries, stored procedures, and Data Manipulation Language (DML) operations. You can customize long SQL queries. You can also set a concurrenc y limit to improve the execution efficiency in the case of high concurrency. The oss_fdw extension is added to support foreign tables of Alibaba Cloud Object Storage Service (OSS). You can write data to OSS, or load data from OSS tables to Apsara PolarDB-P databases. You can compress OSS tables or import data from multiple OSS tables in parallel. This significantly improves the efficiency of data importing and exporting, and helps you separate cold and hot data by using different types of storage media.
Performance optimization	The pre-extension feature is added. This feature automatically adds an index page when there is insufficient page for newly inserted indexes . This feature improves the execution efficiency when data is inserted into an indexed table.

Feature	Description
Ganos 2.7	• MD5 functions are added for spatial raster objects. You can invoke these functions to check data consistency and remove duplication.
	 The ST_MD5Sum function is added to obtain the MD5 hash value of a raster object.
	 The ST_SetMD5Sum function is added to set the MD5 hash value of a raster object.
	OSS authentication functions are added for spatial raster objects:
	 The ST_AKId function is added to obtain the AccessKey ID of a raster object stored in OSS.
	 The ST_SetAccessKey function is added to set the AccessKey ID and AccessKey secret of a raster object stored in OSS.
	 The ST_SetAKId function is added to set the AccessKey ID of a raster object stored in OSS.
	 The ST_SetAKSecret function is added to set the AccessKey secret of a raster object stored in OSS.
	Metadata functions are added for spatial rasters:
	 The ST_ScaleX function is added to obtain the pixel width of a raster object on the X-axis of the spatial reference system. The ST_ScaleY function is added to obtain the pixel width of a raster object on the Y-axis of the spatial reference system.
	 The ST_SetScale function is added to set the pixel width of a raste object in the spatial reference system.
	 The ST_SkewX function is added to obtain the skew of a raster object on the X-axis of the spatial reference system.
	 The ST_SkewY function is added to obtain the skew of a raster object on the Y-axis of the spatial reference system.
	 The ST_SetSkew function is added to set the skew of a raster object in the spatial reference system.
	 The ST_UpperLeftX function is added to obtain the upper-left X- coordinate of a raster object in the spatial reference system.
	- The ST_UpperLeftY function is added to obtain the upper-left Y- coordinate of a raster object in the spatial reference system.
	- The ST_SetUpperLeft function is added to set the upper-left
	coordinates of a raster object in the spatial reference system.The ST_PixelWidth function is added to obtain the pixel width of a
	 raster object in the spatial reference system. The ST_PixelHeight function is added to obtain the pixel height of a method where the spatial reference system.
	a raster object in the spatial reference system.The bug of extension upgrade failures caused by aggregate
	functions is fixed.

3 PolarDB PostgreSQL Quick Start

This topic provides a quick start guide about how to manage PolarDB PostgreSQL clusters, such as creating a cluster, specifying basic configurations, and connecting to a cluster. It allows you to familiarize yourself with the entire process of purchasing and using a PolarDB PostgreSQL cluster.

Procedure

To purchase and use a PolarDB PostgreSQL cluster, follow these steps:

- 1. Create a PolarDB PostgreSQL cluster
- 2. Configure whitelists.
- 3. Create accounts.
- **4.** View connection endpoints.
- 5. Connect to the cluster.

4 Overview of data migration plans

ApsaraDB for PolarDB provides various data migration solutions to meet different business needs such as migrating data to the cloud and migrating data between different cloud service providers. This allows you to smoothly migrate your database to Alibaba Cloud ApsaraDB for PolarDB without affecting your business. By using Alibaba Cloud Data Transmission Service (DTS), you can implement the schema migration and full migration of PolarDB databases.

Data migration

Scenario	Reference
Migrate data from ApsaraDB for RDS to ApsaraDB for PolarDB	Migrate data from ApsaraDB RDS PostgreSQL to PolarDB-P
Migrate data from a user -created database to ApsaraDB for PolarDB	Migrate data from a user-created PostgreSQL database to PolarDB-P

5 Data Migration

5.1 Migrate data from a user-created PostgreSQL database to PolarDB-P

This topic describes how to migrate data from a user-created PostgreSQL database to PolarDB-P by running the pg_dumpall, pg_dump, and pg_restore commands.

For details about how to migrate data from an ApsaraDB RDS for PostgreSQL database, see Migrate data from ApsaraDB RDS PostgreSQL to PolarDB-P.

Prerequisites

The storage capacity of the PolarDB-P instance must be greater than that of the usercreated PostgreSQL database.

Precautions

This is a full migration. To avoid inconsistencies in data, stop the services related to the user -created database and stop data writing before migration.

Preparations

1. Create a Linux ECS instance. This example uses an ECS instance running 64-bit Ubuntu 16.04. For more information, see Create an ECS instance.

- The ECS instance and the destination PolarDB-P instance must be in the same VPC.
- You can create a pay-as-you-go ECS instance and release it after the migration.
- **2.** Install PostgreSQL on the ECS instance to run the data restoration commands. For more information, see PostgreSQL official documentation.

Note:

Ensure that the version of the installed PostgreSQL database is the same as that of the user-created PostgreSQL database.

Step 1: Back up the user-created PostgreSQL database

This is a full migration. To avoid inconsistencies in data, stop the services related to the user -created database and stop data writing before migration.

1. Run the following command on the user-created PostgreSQL database server to back up all the role information in the database.

pg_dumpall -U <username> -h <hostname> -p <port> -r -f <filename>

Parameter description:

- <username>: the account used to log on to the user-created PostgreSQL database.
- <hostname>: the endpoint of the user-created PostgreSQL database. localhost can be used for a local host.
- <port>: the port number of the database service.
- <filename>: the name of the generated backup file.

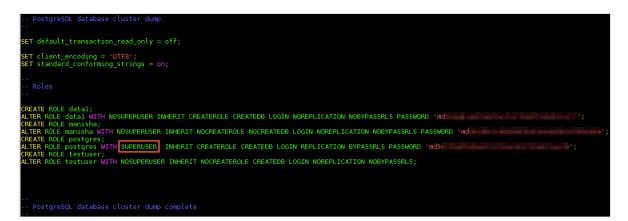

Example:

pg_dumpall -U postgres -h localhost -p 5432 -r -f roleinfo.sql

- **2.** Enter the password in the Password: prompt to start role information backup.
- **3.** Run the vim command to replace SUPERUSER in the role information backup file with polar_superuser.

If the role information backup file does not contain SUPERUSER information, you can skip this step.

4. Run the following command to back up data of the user-created PostgreSQL database.

pg_dump -U <username> -h <hostname> -p <port> <dbname> -Fd -j <njobs> -f < dumpdir>

Parameter description:

- <username>: the account used to log on to the user-created PostgreSQL database.
- <hostname>: the endpoint of the user-created PostgreSQL database. localhost can be used for a local host.
- <port>: the port number of the database service.
- <dbname>: the name of the database to be backed up.
- <njobs>: the number of concurrent backup jobs.

Note:

- Specifying the <njobs> parameter can shorten the dump time, but it also increases the load on the database server.
- If the version of the user-created PostgreSQL database is earlier than 9.2, you must specify the --no-synchronized-snapshots parameter.
- <dumpdir>: the directory of the generated backup file.

Example:

pg_dump -U postgres -h localhost -p 5432 mytestdata -Fd -j 5 -f postgresdump

- **5.** Enter the password in the Password: prompt to start data backup.
- **6.** Wait until the backup is completed. The data in the PostgreSQL database is backed up to the specified directory. In this example, the data is stored in the postgresdump directory.

Step 2: Migrate data to PolarDB-P

1. Upload the directory of backup files to the ECS instance.

Note:

Backup files include role information backup files and database backup files.

2. Run the following command on the ECS instance to migrate role information in backup files to the PolarDB-P instance.

psql -U <username> -h <hostname> -p <port> -d <dbname> -f <filename>

Parameter description:

- <username>: the account used to log on to the PolarDB-P database.
- <hostname>: the primary endpoint (private network) of the PolarDB-P instance.
- <port>: the port number of the database service. The default value is **1921**.
- <dbname>: the name of the database to connect to. The default value is postgres.
- <filename>: the name of the role information backup file.

psql -U gctest -h pc-xxxxxxx.pg.polardb.cn-qd-pldb1.rds.aliyuncs.com -d postgres p 1921 -f roleinfo.sql

- 3. Enter the password in the Password: prompt to start role information import.
- **4.** Run the following command on the ECS instance to restore data to the PolarDB-P instance.

pg_restore -U <username> -h <hostname> -p <port> -d <dbname> -j <njobs> < dumpdir>

Parameter description:

- <username>: the account used to log on to the PolarDB-P database.
- <hostname>: the primary endpoint (private network) of the PolarDB-P instance. For more information, see View connection endpoints.
- <port>: the port number of the database service. The default value is **1921**.
- <dbname>: the name of the destination database to connect to and restore data.

A destination database must be available. If not, create a database in the destination instance.

• <njobs>: the number of concurrent data restoration jobs.

Specifying this parameter can shorten data restoration time, but it also increases the load on the database server.

• <dumpdir>: the directory where the backup file is located.

Example:

pg_restore -U gctest -h pc-mxxxxxx.pg.polardb.cn-qd-pldb1.rds.aliyuncs.com -p 1921 -d mytestdata -j 6 postgresdump

5. Enter the password in the Password: prompt to start data migration.

For details about how to change the password if you forget your password, see Reset the password of a database account.

Wait until the data migration is complete.

5.2 Migrate data from ApsaraDB RDS PostgreSQL to PolarDB-P

This topic describes how to migrate data from a user-created PostgreSQL database to PolarDB-P by running the pg_dump and pg_restore commands.

For details about how to migrate data from an ApsaraDB RDS PostgreSQL database, see Migrate data from a user-created PostgreSQL database to PolarDB-P.

Prerequisites

The storage capacity of the PolarDB-P instance must be greater than that of the ApsaraDB RDS PostgreSQL instance.

Precautions

This is a full migration. To avoid inconsistencies in data, stop the services related to the ApsaraDB RDS PostgreSQL database and stop data writing before migration.

Preparations

1. Create a Linux ECS instance. This example uses an ECS instance running 64-bit Ubuntu 16.04. For more information, see Create an ECS instance.

- The ECS instance and the destination PolarDB-P instance must be in the same VPC.
- You can create a pay-as-you-go ECS instance and release it after the migration.

2. Install PostgreSQL on the ECS instance to run the data restoration commands. For more information, see PostgreSQL official documentation.

Note:

Ensure that the version of the installed PostgreSQL database is the same as that of the ApsaraDB RDS PostgreSQL database.

Step 1: Back up the ApsaraDB RDS PostgreSQL database

This is a full migration. To avoid inconsistencies in data, stop the services related to the ApsaraDB RDS PostgreSQL database and stop data writing before migration.

1. Run the following command on the ECS instance to back up data in the database.

```
pg_dump -U <username> -h <hostname> -p <port> <dbname> -Fd -j <njobs> -f < dumpdir>
```

Parameter description:

- <username>: the account used to log on to the ApsaraDB RDS PostgreSQL database.
- <hostname>: the endpoint of the ApsaraDB RDS PostgreSQL database. localhost can be used for a local host.
- <port>: the port number of the database service.
- <dbname>: the name of the database to connect to. The default value is postgres.
- <njobs>: the number of concurrent backup jobs.

Note:

- Specifying the <njobs> parameter can shorten the dump time, but it also increases the load on the database server.
- If your ApsaraDB RDS PostgreSQL database is earlier than 9.2, you must specify the --no-synchronized-snapshots parameter.
- <dumpdir>: the directory of the generated backup file.

Example:

pg_dump -U postgres -h localhost -p 5432 postgres -Fd -j 5 -f postgresdump

- **2.** Enter the password in the Password: prompt to start data backup.
- **3.** Wait until the backup is completed. The data in the PostgreSQL database is backed up to the specified directory. In this example, the data is stored in the postgresdump directory.

Step 2: Migrate data to PolarDB-P

1. Connect to the PolarDB-P database from the ECS instance.

psql -U <username> -h <hostname> -p <port> -d <dbname>

Parameter description:

- <username>: the account used to log on to the PolarDB-P database.
- <hostname>: the primary endpoint (private network) of the PolarDB-P instance. For more information, see View connection endpoints.
- <port>: the port number of the database service. The default value is **1921**.
- <dbname>: the name of the database to connect to.

Example:

psql -h pc-mxxxxxxx.pg.polardb.cn-qd-pldb1.rds.aliyuncs.com -p 3433 -d postgres -U gctest

- 2. Create a role in the destination PolarDB-P instance based on the role information in the source ApsaraDB RDS PostgreSQL database and grant permissions to the destination database for data restoration. For more information, see CREATE ROLE and GRANT in official documentation.
- **3.** Run the following command on the ECS instance to migrate data of the source database to the PolarDB-P instance.

pg_restore -U <username> -h <hostname> -p <port> -d <dbname> -j <njobs> < dumpdir>

Parameter description:

- <username>: the account used to log on to the PolarDB-P database.
- <hostname>: the primary endpoint (private network) of the PolarDB-P instance.
- <port>: the port number of the database service. The default value is **1921**.
- <dbname>: the name of the destination database to connect to and restore data.

Note:

A destination database must be available. If not, create a database in the destination instance.

<njobs>: the number of concurrent data restoration jobs.

Specifying this parameter can shorten data restoration time, but it also increases the load on the database server.

<dumpdir>: the directory where the backup file is located. •

Example:

pg_restore -U gctest -h pc-mxxxxxx.pg.polardb.cn-qd-pldb1.rds.aliyuncs.com -p 1921 -d postgres -j 6 postgresdump

4. Enter the password in the Password: prompt to start data migration.

Note:

For details about how to change the password if you forget your password, see Reset the password of a database account.

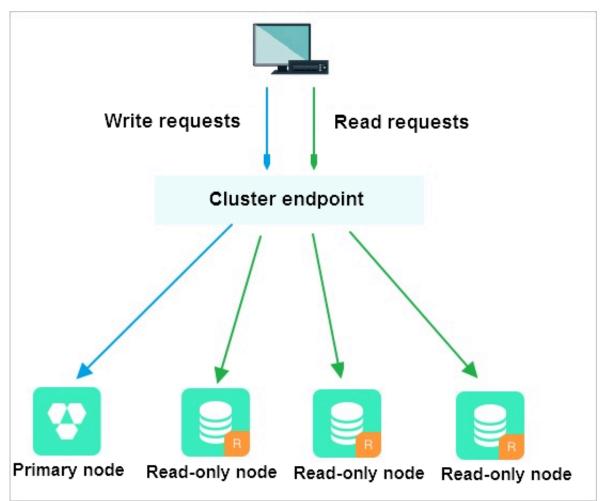

Wait until the data migration is complete.

6 Read/write splitting

PolarDB for PostgreSQL clusters support read/write splitting. Read and write requests sent to a cluster endpoint are automatically forwarded to the relevant nodes.

Context

When there is a large number of read requests but few write requests to a database, a single node may not be able to handle the workload. This may cause core services to be affected. Cluster endpoints automatically forward write requests to the primary node, while read requests are automatically forwarded to read-only nodes. This way, the read capability can be elastically scaled to handle a large number of read requests that are sent to databases.

Benefits

• One endpoint, simplified maintenance

If you do not send requests to the cluster endpoint, you must configure the endpoints of the primary node and each read-only node in the application to send write requests to the primary node and read requests to the read-only nodes. ApsaraDB for PolarDB provides a cluster endpoint. After you connect to this endpoint, read and write requests are automatically forwarded to the primary node and read-only nodes. This reduces maintenance costs. You can expand the capacity of an ApsaraDB for PolarDB cluster by adding read-only nodes, which saves you from making any modifications to applicatio ns.

• Session-level read consistency

When a client connects to the backend through the cluster endpoint, the built-in proxy for read/write splitting automatically establishes a connection with the primary node and each read-only node. In the same session, the built-in proxy first selects an appropriate node based on the data synchronization progress of each database node. Then, the proxy forwards read and write requests to the nodes whose data is up-to-date and correct, balancing the load between read and write requests.

• Load balancing of PREPARE statements

The built-in proxy automatically finds the database nodes that have previously executed PREPARE statements based on the information in EXECUTE statements, balancing the load of extended queries.

• Support for native high security links, improving performance

You can use a user-created proxy on the cloud to achieve read/write splitting. However , excessive latency may occur because data is parsed and forwarded by multiple components before arriving at a database. ApsaraDB for PolarDB utilizes a built-in proxy for read/write splitting, which offers reduced latency and enhanced query performance when compared with external components.

• Node health checks to enhance database availability

The read/write splitting module of ApsaraDB for PolarDB performs health checks on the primary node and read-only nodes of a cluster. When a node fails or its latency exceeds a specified threshold, ApsaraDB for POLARD stops distributing read requests to this node and redirects these requests to other healthy nodes. This ensures that applications can

access the ApsaraDB for PolarDB cluster even if a read-only node fails. When the node is repaired, the node is automatically added to the request distribution system.

Limits

- The following commands or functions are not supported:
 - Connecting to a cluster through the replication-mode method. If you need to set up dual-node clusters based on a primary/secondary replication architecture, use the endpoint of the primary node.
 - The name of the temporary table cannot be used to declare the %ROWTYPE attribute.

create temp table fullname (first text, last text); select '(Joe,von Blow)'::fullname, '(Joe,d''Blow)'::fullname;

- Creating temporary resources by using functions.
 - Executing an SQL statement to query a temporary table that is created by a function may receive an error message indicating that the table does not exist.
 - Executing a function that contains the PREPARE statement may return an error message indicating that the PREPARE statement name does not exist.
- Routing-related restrictions:
 - Multi-statements are routed to the primary node, and all subsequent requests within this session are routed to the primary node.
 - A request message that is greater than or equal to 16 MB is routed to the primary node, and all subsequent requests within this session are routed to the primary node.
 - Requests in the transaction are routed to the primary node, and load balancing is resumed after the transaction terminates.
 - All statements that use functions (except aggregate functions such as COUNT and SUM) are routed to the primary node.

Apply for or change a cluster endpoint

- 1. Log on to the ApsaraDB for PolarDB console.
- **2.** In the upper-left corner of the console, select a region.
- **3.** Click the ID of the target cluster.
- **4.** On the **Overview** page, find **Cluster Endpoints** in the **Connection Information** section.

5. Click **Apply**. In the dialog box that appears, click **Confirm**. Refresh the page to view the cluster endpoint.

Note:

If an existing cluster does not have a cluster endpoint, you must manually apply for a cluster endpoint. A cluster endpoint is automatically assigned to newly purchased clusters. If an ApsaraDB for PolarDB cluster has a cluster endpoint, you can skip to Step 6 to change the endpoint.

 Click Modify. In the Modify Endpoint dialog box, enter a new cluster endpoint and click Submit.

7 Use storage packages

Apsara PolarDB provides subscription storage packages to help you reduce storage costs.

Context

You do not need to manually configure the storage space for Apsara PolarDB. The storage space is automatically changed based on the amount of the stored data. You only need to pay for the storage space that you use. We recommend that you purchase Apsara PolarDB storage packages if you need to store large amounts of data. Compared with the pay-as -you-go billing method, subscription storage packages are more cost-effective. Larger discounts are provided for the storage packages that provide higher storage capacities.

Storage space pricing

For more information about the storage space pricing, see #unique_17/ unique_17_Connect_42_section_u9d_n9d_3jt.

Price comparison between subscription storage packages and the pay-as-you-go billing method

The following table compares the prices of monthly storage packages and the pay-as-you -go billing method. The storage packages that provide higher storage capacities are more cost-effective.

Storage capacity (Mainland China		Outside Mainlan	d China
GB)	Pay-as-you-go (USD/month)	Storage package (USD/ month)	Pay-as-you-go (USD/month)	Storage package (USD/ month)
50	28	28	31	31
100	56	55	62	61
200	112	109	124	121
300	168	163	186	182
500	280	271	310	302
1,000	560	490	620	550
2,000	1,120	980	1,240	1,090
3,000	1,680	1,210	1,860	1,340

Storage capacity (Mainland China		Outside Mainlan	d China
GB)	Pay-as-you-go (USD/month)	Storage package (USD/ month)	Pay-as-you-go (USD/month)	Storage package (USD/ month)
5,000	2,800	2,020	3,100	2,230
10,000	5,600	3,260	6,200	3,630
20,000	11,200	6,510	12,400	7,250
30,000	16,800	9,760	18,600	10,870
50,000	28,000	14,860	31,000	16,550
100,000	56,000	29,720	62,000	33,110

Considerations

- You can purchase only one storage package of each type. The storage packages are divided into two types: storage packages for the regions in Mainland China and storage packages for the regions outside Mainland China.
- A storage package can be used by all the clusters in the regions that are specified by the **package type**.

For more information about storage packages, see FAQ.

Purchase a storage package

- **1.** Login ApsaraDB for PolarDB console.
- **2.** In the upper-left corner of the console, select the region where the cluster is located.
- **3.** On the upper-left corner of the page, click .
- **4.** Log on to the Alibaba Cloud console, and go to the purchase page for Apsara PolarDB storage packages.

5. Click **Storage Package**tab and specify the following parameters.

	Package Type	Mainland China	Outside Mainland China			
Basic		PolarDB storage pack storage package's caj tips: currently, Regior Valley, Virginia, Tokyo	pacity. Is outside Mainland C		Ű	0
	Package Specification	50 GB	100 GB	200 GB	300 GB	500 GB
	speemention	1,000 GB	2,000 GB	3,000 GB	5,000 GB	10,000 GB
		20,000 GB	30,000 GB	50,000 GB	100,000 GB	
Purchase	Purchase Plan	1 montr 2 3	4 5 6	7 8 9	1 yr 1 2 yr	₩ 3 yr 1 5 yr
Plan						

Parameter	Description
Package Type	 Mainland China: The storage package can be used by the Apsara PolarDB clusters that are deployed in the regions in Mainland China. Outside Mainland China: The storage package can be used by the Apsara PolarDB clusters that are deployed in the regions outside Mainland China, including China (Hong Kong).
Package Specification	The storage capacity that is provided by the storage package.
Purchase Plan	The validity period of the storage package.

- 6. Click Buy Now.
- **7.** Read and agree to the service agreement. To agree to the service agreement, select the corresponding check box. Then, click **Pay** to complete the payment.

View the database storage usage

- **1.** Login ApsaraDB for PolarDB console.
- **2.** In the upper-left corner of the console, select the region where the cluster is located.
- **3.** Find the target cluster and click the cluster ID.

4. On the page, check the value of the **Database Storage Usage** field in the **Billing Information** section.

Distributed	d Database Storage 🛛	
	Database Storage Usage 6.64 GB	<u>~~</u>

FAQ

• Question: Are storage packages bound to clusters for sale?

Answer: No, storage packages are not bound to clusters for sale. You must purchase storage packages separately. The storage space that is used by the clusters in the corresponding regions is automatically deducted from the storage package.

• Question: Can a storage package be used by multiple clusters?

Answer: Yes, a storage package can be used by multiple clusters. A storage package can be used by all the clusters in the regions that are specified by the **Package Type** parameter. The values of the parameter are Mainland China and Outside Mainland China.

• Question: Can a storage package be shared by the clusters that use different engines?

Answer: Yes, a storage package can be shared by the clusters that use different engines . A storage package can be shared by PolarDB MySQL, Apsara PolarDB-P, and Apsara PolarDB-O clusters.

• Question: How does the storage space that exceeds the storage capacity of my storage package incur fees?

Answer: The storage space that exceeds the storage capacity of your storage package incurs fees based on the pay-as-you-go billing method. For more information, see #unique_17/unique_17_Connect_42_section_u9d_n9d_3jt.

8 Pending events

When an ApsaraDB for PolarDB event is pending for processing, you will be notified to handle the event in a timely manner in the console.

For ApsaraDB for PolarDB O&M events, including database software upgrade events and hardware maintenance and upgrade events, you are notified not only by SMS messages, phone calls, emails, or internal messages, but also in the console. You can view the details of each event, including the event type, task ID, cluster name, and switch time. You can also change the switch time.

Prerequisites

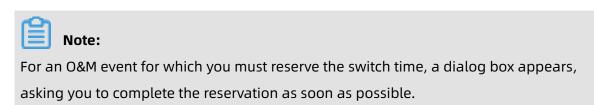

There are unprocessed O&M events.

If there are unprocessed O&M events, you can see notification badges on the **Pending Events** page.

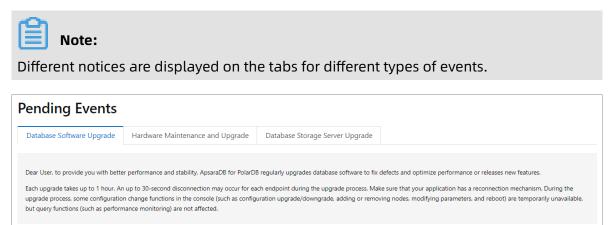

Clusters Pending Events	Database Software Upgrade Hardware Maintenance and Upgrade
Event History	Dear User, to provide you with better performance and stability, ApsaraDB for POLARDB regularly upgrades database software to fix Each upgrade takes up to 1 hour. An up to 30-second disconnection may occur for each connection point during the upgrade proces upgrade/downgrade, adding or removing nodes, modifying parameters, and reboot) are temporarily unavailable, but query functions Modify Switch Time
	Task ID Cluster Name Compatible Database Start Time Engine

Change the switch time

- 1. Log on to the ApsaraDB for PolarDB console.
- 2. In the left-side navigation pane, click **Pending Events**.

3. On the **Pending Events** page, select the type of event that you want to handle.

4. View event details in the event list. To change the switch time, select an event, and then click **Change Switch Time**. In the dialog box that appears, set the switch time, and then click **OK**.

The switch time cannot be later than the latest operation time allowed.

Historical events

You can view completed events on the **Event History** page.

9 Configure a whitelist for a POLARDB for PostgreSQL cluster

POLARDB for PostgreSQL does not support configuring a cluster whitelist. Only instances in the same VPC can access the cluster.

10 Billing management

10.1 Change the billing method from pay-as-you-go to subscription

You can change the billing method of a cluster from pay-as-you-go to subscription based on your needs. Changing billing methods will not impact the performance of your cluster.

Note:

If a cluster uses a specification that is no longer available, you cannot change the billing method of the cluster to subscription. In this case, you must change the cluster specifications before changing the billing method.

Precautions

You cannot change the billing method of a cluster from subscription to pay-as-you-go. Consider your resource requirements before switching the billing method to subscription to avoid resource wastage.

Prerequisites

- The cluster must be in the **Running** state.
- There are no pending orders for changing the billing method from pay-as-you-go to subscription. If there are any pending orders, you must complete payment for or discard them on the Orders page.

Procedure

- **1.** Log on to the ApsaraDB for POLARDB console.
- 2. Select the region where the cluster resides.

 Find the target cluster. In the Actions column corresponding to the cluster, choose ... > Switch to Subscription.

Create Cluster Cluster ID	✓ Enter a value	Q					CRefresh
Cluster Name	Status	Compatible Database Engine	Nodes	Primary Node Specifications	Used Data	Billing Method	Actions
pc- pc-	Running	MySQL 5.6	2	2-Core 4 GB	2.73 GB	Subscription Expires at Sep 21, 2019, 00:00:00	Change Add/Remove Configurations Node
pc- car	Running	MySQL 5.6	2	4-Core 16 GB	2.80 GB	Pay-As-You-Go (Hourly Rate) Created at Aug 20, 2019, 13:04:53	Change Add/Remove Configurations Node

pc-	Running	MySQL 5.6	2	4-Core 16 GB	2.73 GB	Pay-As-You-Go (Hourly Rate) Created at Aug 20, 2019, 11:29:34	Release Change Add/Remove Configurations Node

4. Specify Purchase Plan, read the ApsaraDB for POLARDB Subscription Agreement of Service. Select the check box to indicate that you agree to it, and then click Pay to complete the payment.

Note:

- The new billing method takes effect after you complete the payment.
- If the order is unpaid or the payment fails, an unfinished order appears on the Orders page. You cannot buy a new cluster or switch the billing method of existing clusters before the unfinished order is completed. You must complete payment for or discard the order before placing a new one.

10.2 Manually renew the subscription to a cluster

You can renew your subscription to clusters in the ApsaraDB for PolarDB console or in the Renew console. In the Renew console, you can renew your subscription to multiple clusters at the same time.

📋 Note:

Clusters purchased through the pay-as-you-go (hourly rate) billing method do not involve expiration and renewal.

Method 1: Renew the subscription in the ApsaraDB for PolarDB console

- 1. Log on to the ApsaraDB for PolarDB console.
- **2.** Select a region in the upper-left corner to view all the clusters that you deploy in this region.

3. Find the target cluster, click the More icon in the Actions column, and choose Renew

from the shortcut menu.

Clusters							
Create Cluster ID	▶ ∨] Enter a value	Q					GRefresh
Cluster Name	Status	Compatible Database Engine	Nodes	Primary Node Specifications	Used Data	Billing Method	Actions
pc- pc-	Running	MySQL 5.6	2	2-Core 4 GB	2.73 GB	Subscription Expires at Sep 21, 2019, 00:00:00	Change Add/Remove
pc- car	Running	MySQL 5.6	2	4-Core 16 GB	2.80 GB	Pay-As-You-Go (Hourly Rate) Created at Aug 20, 2019, 13:04:53	Clone Cluster Restore to New Cluster Renew

4. Specify the renewal duration, select the service agreement, and click **Pay**.

Method 2: Renew the subscription in the Renew console

- **1.** Log on to the ApsaraDB for PolarDB console.
- 2. In the upper-right corner of the console, choose **Billing Management > Renew**.

ba C	loud Indonesia (Ja	karta) 🕶				(Q Billing Management	More	≥_
	1						Orders		
	Clusters						Billing Management		
	Create Cluster	Cluster ID \sim Enter a value	Q				Renew		
	Cluster Name	Status	Compatible Database Engine	Nodes	Primary Node Specifications	Used Data	Billing Method	Actio	ns

- 3. In the left-side navigation pane, click **ApsaraDB for PolarDB**.
- Click the Manually Renew tab. Set the filtering conditions to find the target cluster. Click
 Renew in the Actions column corresponding to the cluster.

Note:

To enable manual renewal for a cluster on the **Auto-Renew** or **Don't Renew** tab, click **Enable Manual Renew**, and then click **OK** in the dialog box that appears.

5. Specify the renewal duration, select the service agreement, and click Pay.

Enable automatic renewal

If you enable automatic renewal, you will be free from regular manual renewal operations and concerns of service interruptions. For more information, see Automatically renew the subscription to a cluster.

10.3 Automatically renew the subscription to a cluster

A subscription-based cluster has a validity period. If the cluster is not renewed in a timely manner, service interruptions or even data loss will occur after it expires. If you enable

automatic renewal, you will be free from regular manual renewal operations and concerns of service interruptions.

Note:

Clusters purchased through the pay-as-you-go (hourly rate) billing method do not involve expiration and renewal.

Precautions

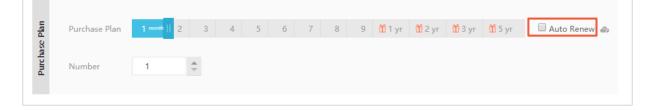

- Automatic fee deduction will begin nine days prior to the expiration of the cluster, supporting cash and coupons. Keep your account balance adequate.
- If you manually renew the cluster before the automatic deduction, the system will automatically renew the cluster nine days prior to the next expiration.
- The automatic renewal feature takes effect the next day after it is enabled. If your cluster expires the next day, renew it manually to prevent service interruptions. For more information, see Manually renew the subscription to a cluster.

Enable automatic renewal when purchasing a cluster

Note:

After you enable automatic renewal, the system will automatically renew the subscription based on the **subscription period**. For example, if you purchase a cluster for three months and select automatic renewal, you will be charged a fee of the three-month subscription upon each automatic renewal.

When creating a cluster, you can select **Auto Renew**.

Enable automatic renewal after purchasing a cluster

Note:

After you enable automatic renewal, the system will automatically renew the subscription based on the renewal cycle you select. For example, if you select a three-month renewal cycle, you will be charged a fee of the three-month subscription upon each automatic renewal.

- 1. Log on to the ApsaraDB for PolarDB console.

11 Connect to a database cluster

11.1 View connection endpoints

This topic describes how to view connection endpoints of the POLARDB cluster and introduces primary endpoints and private endpoints.

Procedure

- **1.** Log on to the ApsaraDB for POLARDB console.
- **2.** Find the target cluster and click the cluster ID.
- **3.** In the **Connection Information** section, view the connection endpoints.

Primary endpoints

Туре	Description	Supported network type
Primary endpoint	A primary endpoint always connects to the primary node and supports read and write operations. If the primary node becomes faulty, the primary endpoint is automatically switched to the read-only node that is promoted to the primary node.	VPC
Primary node endpoint (not recommended)	The endpoint of the primary node. It is not recommende d to connect directly to the primary node because the node is unavailable when it fails.	VPC
Read-only node endpoint (not recommended)	The endpoint of the read-only node. It is not recommended to connect directly to the read-only node because the node is unavailable when it fails.	VPC

Private endpoints

Туре	Description	Scenario
Private endpoir	performance when accessed through	 For example: If your ECS instance is located in the same VPC as the POLARDB cluster , then your ECS instance can access the POLARDB cluster through the private endpoint. You can access the POLARDB cluster through the private endpoint by using DMS.

Next step

Connect to the cluster. For more information, see Connect to a POLARDB for PostgreSQL cluster.

Related API operations

11.2 Connect to a POLARDB for PostgreSQL cluster

This topic describes how to connect to a POLARDB for PostgreSQL cluster.

Use DMS to connect to a POLARDB for PostgreSQL cluster

Data Management (DMS) provides an integrated solution for data management. DMS supports data management, schema management, access control, BI charts, trend analysis, data tracing, performance optimization, and server management. DMS supports relational databases such as MySQL, SQL Server, and PostgreSQL, as well as NoSQL databases such as MongoDB and Redis. DMS also supports the management of Linux servers.

Prerequisites

You have created a privileged or standard account for an existing database cluster. For more information, see Create a database account.

Procedure

1. Find the target cluster and click the cluster ID to go to the basic information page.

2. Click **Log On to Database** in the upper-right corner of the page.

Cluster pc-bp • Running Cluster pc-bp • Running Clone Cluster Synchronize Data...

3. On the database logon page, enter the endpoint and the port number, and separate them with a colon (:). Then enter the username and the password of the privileged or standard account, and click **Log On**.

Note:

DMS logon only supports the endpoint and does not support the cluster address.

For more information about how to view the endpoint, see View connection endpoints.

Use a client to connect to a POLARDB for PostgreSQL cluster

POLARDB for PostgreSQL does not support setting a whitelist for a cluster. Only instances that are in the same VPC can access the cluster. Therefore, the server where the client resides and the POLARDB compatible with Oracle cluster must be in the same VPC.

- **1.** Start the pgAdmin 4 client.
- Right-click Servers and choose Create > Server from the shortcut menu, as shown in the following figure.
- **3.** On the **General** tab of the **Create Server** dialog box, enter the name of the server, as shown in the following figure.

4. Click the **Connection** tab and enter the information of the instance to connect to, as shown in the following figure.

Parameter description:

- **Hostname or IP Address**: the internal IP address of the POLARDB for PostgreSQL cluster. To view the endpoint and port information of the POLARDB for PostgreSQL cluster, follow these steps:
 - a. Log on to the ApsaraDB for POLARDB console.
 - **b.** Find the target cluster and click the cluster ID.
 - **c.** In the **Connection Information** section, view the endpoint and port information.
- **Port**: the internal port of the POLARDB for PostgreSQL cluster.
- **User Name**: the name of the privileged account of the POLARDB for PostgreSQL cluster.
- **Password**: the password of the privileged account of the POLARDB for PostgreSQL cluster.
- 5. Click Save.
- 6. If the connection information is correct, choose Servers > Server Name > Databases > postgres. The connection is successful if the following interface is displayed.

Note:

postgres is the default system database of the POLARDB for PostgreSQL cluster. Do not perform any operation on the database.

11.3 Modify a cluster endpoint

An Apsara PolarDB cluster endpoint is used as a unified portal to access all nodes in the cluster. It provides capabilities such as high availability, read/write splitting, and automatic load balancing. This topic describes how to modify the consistency level for the endpoint of a PolarDB for PostgreSQL cluster.

Procedure

- 1. Login ApsaraDB for PolarDB console.
- **2.** In the upper-left corner of the console, select the region where the cluster is located.
- **3.** Find the target cluster and click the cluster ID.

4. On the **Overview** page, click **Modify** in the **Connection Information** section.

ndpoints		::

12 Cluster management

12.1 Create a PolarDB for PostgreSQL cluster

This topic describes how to create a PolarDB for PostgreSQL cluster in the console.

Prerequisites

You have created an Alibaba Cloud account or created a Resource Access Management (RAM) account.

- Click here to register an Alibaba Cloud account.
- For more information about how to create and grant permissions to a RAM user, see Create and authorize a RAM user.

Context

A cluster contains one primary node and a maximum of 15 read-only nodes. At least one read-only node is required to implement active-active high availability architecture. A node is a virtual database server, where you can create and manage multiple databases.

- ApsaraDB for PolarDB supports Virtual Private Cloud (VPC) only. VPC is an isolated network in Alibaba Cloud that is more secure than a classic network.
- To achieve optimal performance, use ApsaraDB for PolarDB with Elastic Compute Service (ECS) and place them in the same VPC. If your ECS instance is created in a classic network, you must migrate it to a VPC.

Procedure

- **1.** Log on to Alibaba Cloud.
 - Click here to log on with your Alibaba Cloud account.
 - Click here to log on with your RAM user account. For more information, see Log on as a RAM user.
- 2. Click Create Cluster to go to the ApsaraDB for PolarDB purchase page.

- 3. Select Subscription or Pay-As-You-Go.
 - Subscription: You must pay for the compute nodes (a primary node and a read-only node) when you create the cluster. Storage consumed by your database is billed in GB/hour increments and the charges are deducted from your account on an hourly basis. The Subscription method is more cost-effective if you want to use the new cluster for a long period of time. The longer the subscription period, the greater the discount.
 - Pay-As-You-Go: This method does not require any upfront payment. Compute nodes and storage consumed by your database are billed on an hourly basis and the charges are deducted from your account on an hourly basis. The Pay-As-You-Go method is suitable if you only want to use the new cluster for a short period of time. You can save costs by releasing clusters as needed.

Console section	Parameter	Description		
Basic	Region	The region where the cluster resides. You cannot change the region after you confirm your order.		
		Note: Make sure that you place your cluster in the same VPC as the ECS instance you want to connect to. Otherwise, they cannot communicate through the internal network and achieve optimal performance.		
	Create Type	The method to create an ApsaraDB for PolarDB cluster. For the PostgreSQL engine, choose Create Primary Cluster .		
	Primary Availability Zone	 The zone of the cluster. Zones are independent physical areas in one region. There are no differences between the zones. Your cluster and the ECS instance to be connected can be located in the same zone or in different zones. 		
	Network Type	 You do not need to specify this parameter. ApsaraDB for PolarDB supports VPC only. A VPC is an isolated virtual network with higher security and performance than a classic network. 		

4. Configure the following parameters.

Console section	Parameter	Description
	VPC VSwitch	Make sure that you place your cluster in the same VPC as the ECS instance you want to connect to. Otherwise, they cannot communicate through the internal network and achieve optimal performance.
		 If you have created a VPC that meets your network plan, select the VPC. For example, if you have created an ECS instance and the VPC where it resides meets your network plan, select this VPC. Alternatively, use the default VPC and VSwitch.
		 Default VPC: It is a unique VPC in your selected zone. The network mask for a default VPC has 16 bits, such as 172.31.0.0/16, providing up to 65,536 internal IP addresses. It is not included in the total number of VPCs that you can create. Default VSwitch:
		 It is a unique VSwitch in your selected zone. The network mask for a default VSwitch has 20 bits, such as 172.16.0.0/20, providing up to 4,096 private IP addresses. The default VSwitch is not included in the total number of VSwitches that you can create in a VPC. If the default VPC and VSwitch cannot satisfy your requirements, you can create your own VPC and VSwitch.
Instance	Database Engine	Fully compatible with PostgreSQL 11.
	Node Specificat ions	Select the specifications as needed. All ApsaraDB for PolarDB nodes are dedicated, providing stable and reliable performance. For more information, see #unique_17.

Console section	Parameter	Description
	Number of Nodes	 You do not need to specify this parameter. By default, the system will create a read-only node that has the same specifications as the primary node. If the primary node fails, the system automatically promotes the read-only node as the primary node, and generate a new read-only node. For more information about read-only nodes, see #unique_34.
	Storage Cost	You do not need to specify this parameter. The system will charge you on an hourly basis based on the actual data usage. For more information, see #unique_17.
		Note: You do not need to select a storage capacity when you purchase a cluster. The storage capacity will automatically resize based on your data usage.

 Specify Purchase Plan (only applicable to subscription clusters) and Number, and click Buy Now.

Note:

A maximum of 50 clusters can be created at a time, which is suitable for business scenarios such as launching multiple gaming servers at a time.

6. On the **Confirm Order** page, confirm your order information, read and accept the **ApsaraDB for PolarDB Subscription Agreement of Service**, and then click **Pay**.

After the payment is completed, the cluster is created in about 10 minutes. The created cluster is displayed in the cluster list.

Note:

- The cluster is unavailable and is still being created if some of the nodes are in the Running state. The cluster is available only when the cluster is in the Running state.
- Make sure that you have selected the correct region. Otherwise, you cannot view your clusters.

Next step

Create database accounts. For more information, see Create a database account.

#unique_25	Used to set the automatic renewal status of a PolarDB cluster that uses the Subscription billing method.

12.2 Use storage packages

Apsara PolarDB provides subscription storage packages to help you reduce storage costs.

Context

You do not need to manually configure the storage space for Apsara PolarDB. The storage space is automatically changed based on the amount of the stored data. You only need to pay for the storage space that you use. We recommend that you purchase Apsara PolarDB storage packages if you need to store large amounts of data. Compared with the pay-as -you-go billing method, subscription storage packages are more cost-effective. Larger discounts are provided for the storage packages that provide higher storage capacities.

Storage space pricing

For more information about the storage space pricing, see #unique_17/ unique_17_Connect_42_section_u9d_n9d_3jt.

Price comparison between subscription storage packages and the pay-as-you-go billing method

The following table compares the prices of monthly storage packages and the pay-as-you -go billing method. The storage packages that provide higher storage capacities are more cost-effective.

Storage capacity (Mainland China		Outside Mainland China	
GB)	Pay-as-you-go (USD/month)	Storage package (USD/ month)	Pay-as-you-go (USD/month)	Storage package (USD/ month)
50	28	28	31	31
100	56	55	62	61
200	112	109	124	121
300	168	163	186	182
500	280	271	310	302
1,000	560	490	620	550
2,000	1,120	980	1,240	1,090
3,000	1,680	1,210	1,860	1,340
5,000	2,800	2,020	3,100	2,230
10,000	5,600	3,260	6,200	3,630
20,000	11,200	6,510	12,400	7,250
30,000	16,800	9,760	18,600	10,870
50,000	28,000	14,860	31,000	16,550
100,000	56,000	29,720	62,000	33,110

Considerations

- You can purchase only one storage package of each type. The storage packages are divided into two types: storage packages for the regions in Mainland China and storage packages for the regions outside Mainland China.
- A storage package can be used by all the clusters in the regions that are specified by the **package type**.

Note:

For more information about storage packages, see FAQ.

Purchase a storage package

- **1.** Login ApsaraDB for PolarDB console.
- **2.** In the upper-left corner of the console, select the region where the cluster is located.
- **3.** On the upper-left corner of the page, click .

4. Log on to the Alibaba Cloud console, and go to the purchase page for Apsara PolarDB storage packages.

5. Click **Storage Package**tab and specify the following parameters.

	Package Type		Outside Mainland				
		Mainland China	China				
Basic		storage package's ca	oacity. Is outside Mainland C		_	n. The storage is charg	
	Package	50 GB	100 GB	200 GB	300 GB	500 GB	
	Specification	1,000 GB	2,000 GB	3,000 GB	5,000 GB	10,000 GB	
		20,000 GB	30,000 GB	50,000 GB	100,000 GB		
Purcha	Purchase Plan	1 month 2 3	4 5 6	7 8 9	1 yr 🛱 2 yr	箭 3 yr 箭 5 yr	
se Plan							

Parameter	Description	
Package Type	 Mainland China: The storage package can be used by the Apsara PolarDB clusters that are deployed in the regions in Mainland China. Outside Mainland China: The storage package can be used by the Apsara PolarDB clusters that are deployed in the regions outside Mainland China, including China (Hong Kong). 	
Package Specification	The storage capacity that is provided by the storage package.	
Purchase Plan	The validity period of the storage package.	

- 6. Click Buy Now.
- **7.** Read and agree to the service agreement. To agree to the service agreement, select the corresponding check box. Then, click **Pay** to complete the payment.

View the database storage usage

- **1.** Login ApsaraDB for PolarDB console.
- **2.** In the upper-left corner of the console, select the region where the cluster is located.
- **3.** Find the target cluster and click the cluster ID.

4. On the page, check the value of the **Database Storage Usage** field in the **Billing Information** section.

Distributed	d Database Storage 🕢	
	Database Storage Usage 6.64 GB	<u>~~</u>

FAQ

• Question: Are storage packages bound to clusters for sale?

Answer: No, storage packages are not bound to clusters for sale. You must purchase storage packages separately. The storage space that is used by the clusters in the corresponding regions is automatically deducted from the storage package.

• Question: Can a storage package be used by multiple clusters?

Answer: Yes, a storage package can be used by multiple clusters. A storage package can be used by all the clusters in the regions that are specified by the **Package Type** parameter. The values of the parameter are Mainland China and Outside Mainland China.

• Question: Can a storage package be shared by the clusters that use different engines?

Answer: Yes, a storage package can be shared by the clusters that use different engines . A storage package can be shared by PolarDB MySQL, Apsara PolarDB-P, and Apsara PolarDB-O clusters.

• Question: How does the storage space that exceeds the storage capacity of my storage package incur fees?

Answer: The storage space that exceeds the storage capacity of your storage package incurs fees based on the pay-as-you-go billing method. For more information, see #unique_17/unique_17_Connect_42_section_u9d_n9d_3jt.

12.3 Configure cluster parameters

This topic describes how to modify parameter values of a cluster in the ApsaraDB for PolarDB console.

Precautions

• You must modify parameter values according to the **Value Range** column on the Parameters page.

Backup and Restore	character_set_server (?)	utf8	Yes	utf8	[utf8 latin1 gbk utf8mb4]
Parameters Diagnostics and Opti	default_time_zone @	SYSTEM	Yes	SYSTEM	[SYSTEM]-12.00[-11:00]-10:00[-9:00]-8:00[-7:00]-6:00[-5:00]-4:00]-3:00]-2:00] -1:00[+0:00[+1:00[+2:00]+3:00]+4:00[+5:00[+5:30]+6:30]+7:00[+ 8:00[+9:00]+10:00[+11:00]+12:00[+13:00]
Cluster Overview	loose_polar_log_bin ()	ON_WITH_GTID	Yes	OFF	[ON_WITH_GTID OFF]

 For some parameters, you must restart all nodes after the parameter values are modified. We recommend that you make appropriate service arrangements before you restart the nodes. Proceed with caution. You can determine whether the modification of a parameter value requires a node restart according to the value in the Force Restart column on the Parameters page.

Name	Current Value	Force Restart	Default Value
character_set_filesystem ⑦	binary	No	binary
character_set_server (?)	utf8	Yes	utf8
default_time_zone (?)	SYSTEM	Yes	SYSTEM
loose_polar_log_bin ⑦	ON_WITH_GTID	Yes	OFF
autocommit 🕥	ON	No	ON
automatic_sp_privileges @	ON	No	ON

Procedure

- **1.** Log on to the ApsaraDB for PolarDB console.
- 2. Select a region.
- **3.** Find the target cluster and click the cluster ID in the **Cluster Name** column.
- **4.** In the left-side navigation pane, choose **Settings and Management > Whitelists**.

5. Modify the values of one or more parameters in the **Current Value** column, and click

Apply Changes Undo All Enter a va	alue Q		
Name	Current Value	Force Restart	Default Value
character_set_filesystem ③	binary	No	binary
character_set_server @	utf8	Yes	utf8
default_time_zone (?)	SYSTEM	Yes	SYSTEM
loose_polar_log_bin @	ON_WITH_GTID	Yes	OFF

Apply Changes.

6. In the Save Changes dialog box that appears, click OK.

Save Changes			×
The instance will parameter change	restart after you change the parameters. Ar jes?	e you sure you want to subm	it the

12.4 Change the cluster specifications

This topic describes how to change the specifications of your cluster to meet business requirements.

ApsaraDB for POLARDB supports capacity scaling in three dimensions:

• Vertical scaling of computing power

You can upgrade or downgrade the specifications of a cluster. This topic describes the details.

Horizontal scaling of computing power

You can add or delete read-only nodes. For more information, see Add or remove a read-only node.

Horizontal scaling of storage capacity

The storage capacity is provisioned in a serverless model. As your data increases in size, the storage is automatically expanded.

You can upgrade or downgrade the specifications of an ApsaraDB for POLARDB cluster. It takes only 5 minutes to 10 minutes for the new specifications of each node to take effect.

Specification change fees

For more information, see **#unique_41**.

Prerequisites

You can only change cluster specifications when the cluster does not have pending specification changes.

Precautions

- Specification upgrades or downgrades only apply to clusters. You cannot change the specifications of a node.
- Specification upgrades or downgrades do not affect the existing data in the cluster.
- We recommend that you modify cluster specifications during off-peak periods. During
 a specification upgrade or downgrade, the ApsaraDB for POLARDB service will be
 disconnected for a few seconds and some of the functions will be disabled. You will
 need to reconnect from your applications after the service is disconnected.

Procedure

1. Log on to the ApsaraDB for POLARDB console.

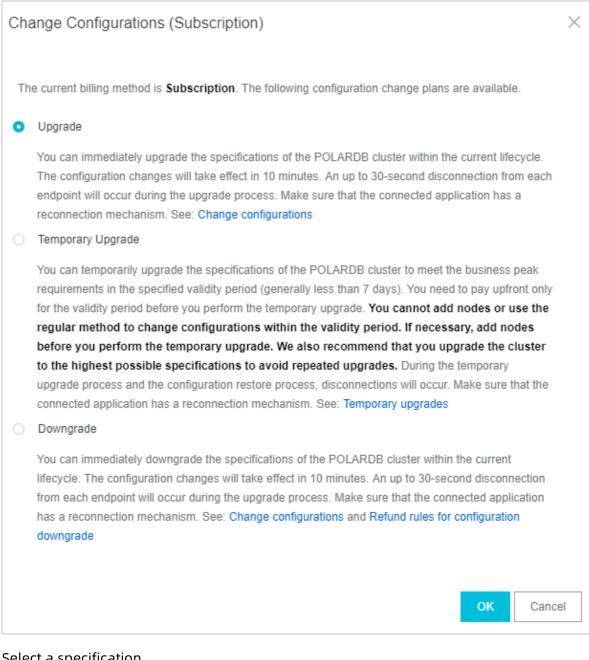

- 2. In the upper-left corner of the page, select the region.
- **3.** Go to the **Change Configurations** page. Perform the operation by using either of the following methods:
 - Find the target cluster and click **Change Configurations** in the **Actions** column corresponding to the target cluster.

Create Cluster ID V	/ Enter a value	Q					C Refresh
Cluster Name	Status	Compatible Database Engine	Nodes	Primary Node Specifications	Used Data	Billing Method	Actions
pc. DT	Running	MySQL 8.0	2	4-Core 16 GB	3.85 GB	Pay-As-You-Go (Hourly Rate) Created at Aug 5, 2019, 13:51:42	Change Configurations Node

• Find the target cluster, click the cluster ID, and then click **Change Configurations** in the **Node Information** section.

Node Information						
Add/Remove Node Change Configuration	15					
Node Name	Zone	Status	Current Role	Specifications	Maximum IOPS	Actions
pi-bp	Hangzhou Zone I	Running	Primary Node	4-Core 16 GB	32000	Restart
pi-bp	Hangzhou Zone I	 Running 	Read-only Node	4-Core 16 GB	32000	Restart

4. Select Upgrade or Downgrade and click OK.

5. Select a specification.

All nodes in a cluster have the same specifications.

6. Read and agree to the service agreement by selecting the check box, and click Pay to complete the payment.

It takes about ten minutes for the new specifications to take effect.

Related API operations

ΑΡΙ	Description
#unique_42	Changes the specifications of a POLARDB cluster.

12.5 Add or remove a read-only node

You can manually add or remove read-only nodes after creating an ApsaraDB for POLARDB cluster. An ApsaraDB for POLARDB cluster can contain a maximum of 15 read-only nodes. The cluster must have at least one read-only node to guarantee high availability. All nodes in a cluster have the same specifications.

Billing

The billing methods for nodes added to an existing cluster are as follows:

- If nodes are added to a subscription cluster, the nodes are billed as subscription nodes.
- If nodes are added to a pay-as-you-go cluster, the nodes are billed as pay-as-you-go nodes.

- Read-only nodes that you purchase in either subscription or pay-as-you-go mode can be released at any time. After they are released, the system will refund or stop billing.
- The added nodes are only charged based on the node specifications. For more information, see #unique_17. The storage fee is charged based on the actual data volume, regardless of the number of nodes.

Precautions

- You can only add or remove read-only nodes when the cluster does not have pending specification changes.
- To avoid misoperations, only one read-only node can be added or removed at a time. You must perform the add or remove operation for each node.
- It takes about 5 minutes to add or remove a node.

Add a read-only node

- **1.** Log on to the ApsaraDB for POLARDB console.
- 2. Select a region.

- **3.** Go to the **Add/Remove Node** page. Perform the operation by using either of the following methods:
 - Find the target cluster and click **Add/Remove Node** in the **Actions** column.

Clusters							
Create Cluster ID V	 Enter a value 	Q					🖒 Refresh
Cluster Name	Status	Compatible Database Engine	Nodes	Primary Node Specifications	Used Data	Billing Method	Actions
p. laforhalds likey p. laforhalds like	 Running 	MySQL 5.6	2	16-Core 128 GB	2.88 GB	Subscription Expires at Aug 28, 2019, 00:00:00	Change Add/Remove Configurations Node

 Find the target cluster, click the cluster ID, and then click Add/Remove Node in the Node Information section.

Node Information							
Add/Remove Node Change Configur	ations						
Node Name	Zone	Status	Current Role	Specifications	Maximum IOPS	Actions	
pi-bp	Hangzhou Zone I	 Running 	Primary Node	16-Core 128 GB	128000	Restart

4. Select Add Node and click OK.

Add/Remove Node	\times
The current billing method is Subscription . The following configuration change plans are available.	
 Add Node 	
You can immediately add a database compute node to a POLARDB cluster within the current lifecycle. It takes about 5 minutes to add a node. The entire process does not affect the databases. You can use the default cluster endpoint to automatically identify the new node and load balance requests to the new node to achieve load balancing without modifying the application configurations. See: Add a node and Pricing for adding a node to a subscription cluster	
O Remove Node	
You can immediately remove a database compute node from the POLARDB cluster within the current lifecycle. All connections on the removed node will be terminated, but other nodes will not be affected. You can use the cluster endpoint to automatically ignore the failed node without modifying the application configurations. See: Remove a node and Refund rules for removing a node from a subscription cluster	
OK Cance	əl

5. Click the icon to add a read-only node. Read and agree to the service agreement

by selecting the check box, and click **Pay** to complete the payment.

Remove a read-only node

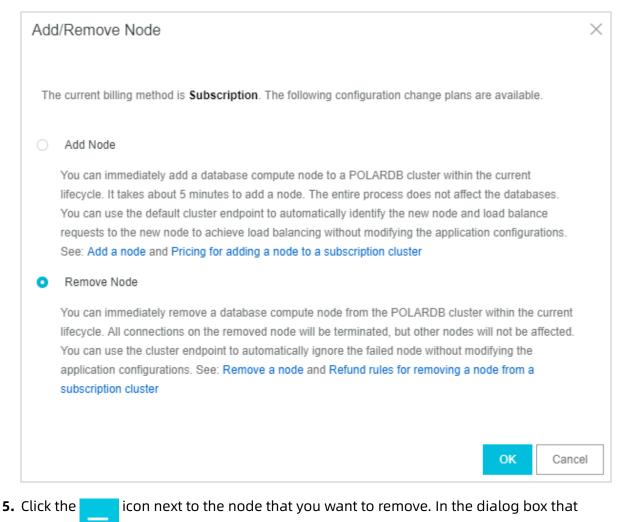

- **1.** Log on to the ApsaraDB for POLARDB console.
- **2.** Select a region.
- **3.** Go to the **Add/Remove Node** page. Perform the operation by using either of the following methods:
 - Find the target cluster and click **Add/Remove Node** in the **Actions** column.

12.6 Set the maintenance window

This topic describes how to set the maintenance window for an ApsaraDB for PolarDB cluster. To guarantee the stability of ApsaraDB for PolarDB, the backend system performs maintenance operations on the clusters from time to time. We recommend that you set the maintenance window within the off-peak hours of your business to minimize the impact on the business during the maintenance process.

Important notes

- Before the maintenance is performed, ApsaraDB for PolarDB sends SMS messages and emails to contacts listed in your Alibaba Cloud account.
- To guarantee stability during the maintenance process, clusters first enter the Under Maintenance state before the preset maintenance window arrives on the day of maintenance. When a cluster is in this state, normal data access to the database is not affected. However, except for the account management, database management, and IP address whitelisting functions, other services concerning changes (such as common operations like upgrade, degrade, and restart) are unavailable in the console of this cluster. Query services such as performance monitoring are still available.
- Within the maintenance window of a cluster, the cluster may experience one or two disconnections. Make sure that your application can automatically reconnect to the cluster. The cluster restores to normal immediately after the disconnection occurs.

Procedure

- **1.** Log on to the ApsaraDB for PolarDB console.
- 2. Select a region.
- 3. Find the target cluster and click the cluster ID in the **Cluster Name** column.

4. In the Basic Information section on the Basics page, click Modify next to Maintenance

Window.

Basic Information			
Cluster ID	pc	Cluster Name	p¢ Edit

12.8 Release a cluster

You can manually release a pay-as-you-go cluster according to your business requirements

Precautions

- A subscription cluster cannot be manually released and will be automatically released after the subscription expires.
- A pay-as-you-go cluster can only be manually released when it is in the Running state.
- All the data in your cluster will be deleted when the cluster is released. Proceed with caution.
- This function is used to release a cluster, including all nodes in the specified cluster. To release one read-only node, see Add or remove a read-only node.
- You can switch the billing method of a cluster from pay-as-you-go to subscription. For more information, see Change the billing method from pay-as-you-go to subscription.

Procedure

- **1.** Log on to the ApsaraDB for POLARDB console.
- 2. Select a region.
- 3. Find the target cluster. In the Actions column corresponding to the cluster, click ... >

Release.

АРІ	Description
#unique_35	Views the list of POLARDB clusters.
#unique_50	Deletes a POLARDB cluster.

12.9 Clone a cluster

This topic describes how to clone an ApsaraDB for PolarDB cluster. You can create an ApsaraDB for PolarDB cluster that is the same as an existing ApsaraDB for PolarDB cluster by cloning the data of the existing one. The data includes the account information, but excludes parameter settings of the cluster.

The data generated before the execution of the clone action is cloned. When cloning starts, the newly written data will not be cloned.

Procedure

- 1. Log on to the ApsaraDB for PolarDB console.
- **2.** Select the region where the target cluster is located.
- **3.** Find the cluster you want to clone. In the **Actions** column of the cluster, click the **More** icon, and then select **Restore to New Cluster**.
- **4.** On the page that appears, set the parameters. The following table describes the parameters.

Parameter	Description
Clone Source Type	The type of the clone source. Select Current Cluster .
Region	The region where the cluster resides. The region of the new cluster is the same as that of the source cluster and cannot be modified.
Primary Availability Zone	 The zone of the new cluster. A zone is an independent physical area located within a region. There are no substantive differences between the zones. You can deploy the ApsaraDB for PolarDB cluster and ECS instance in the same zone or in different zones.
Network Type	 The type of the network. Use the default setting. ApsaraDB for PolarDB supports Virtual Private Cloud (VPC) networks only. A VPC is an isolated virtual network with higher security and performance than a classic network.

Parameter	Description
VPC Vswitch	The VPC and VSwitch of the new cluster. Select a VPC and a VSwitch from the corresponding drop-down lists, or create a VPC and a VSwitch.
	Note: Make sure that you place your ApsaraDB for PolarDB cluster and the ECS instance to be connected in the same VPC. Otherwise, they cannot intercommunicate through the internal network and achieve optimal performance.
Database Engine	The database engine of the new cluster. Use the default setting.
Node Specificat ion	The node specification of the new cluster. Select a specification according to your needs. Clusters with different specifications have different storage capacity and performance. For more information, see #unique_17.
Number Nodes	The number of nodes in the new cluster. Use the default setting. By default , the system creates a read-only node with the same specification as the primary node.
Cluster Name	 Optional. The name of the new cluster. The system will automatically create a name for your ApsaraDB for PolarDB cluster if you leave it blank. You can rename the cluster after it is created.
Purchase Plan	The subscription duration of the new cluster. This parameter is valid only for subscription clusters.
Number	The number of clusters. The default value 1 is used and cannot be modified.

5. Read the **ApsaraDB for PolarDB Agreement of Service**, select the check box to agree to it, and then complete the payment.

12.10 Upgrade the minor version

You can manually upgrade the minor kernel version of ApsaraDB PolarDB for PostgreSQL.The upgrades improve performance, provide new feature, or fix bugs.

Precautions

- Upgrading the kernel minor version will restart the instance. We recommend that you
 perform the upgrade during off-peak hours or make sure that your applications can
 automatically reconnect to the instance.
- You cannot downgrade the minor version after an upgrade.

Procedure

- **1.** Log on to the PolarDB console.
- 2. In the upper-left corner of the page, select the region where the PolarDB cluster is located.

😑 🕞 Alibaba Cloud	China (Hangzh 🔺

Accounts			Window								

5. In Upgrade to Latest Version dialog box, click OK.

Note:

During the upgrade, services may be interrupted for about 60 seconds. Make sure that your applications can automatically reconnect to the instance.

12.11 Switch workloads from writer nodes to reader nodes

An Apsara PolarDB cluster consists of one writer node and one or more reader nodes. This topic describes how to switch your workloads from a writer node to a reader node. If a failure occurs on a writer node, the system can automatically perform a failover. You may want to manually switch your workloads from the writer node to a reader node to run a disaster recovery drill and to specify a certain reader node as the writer node.

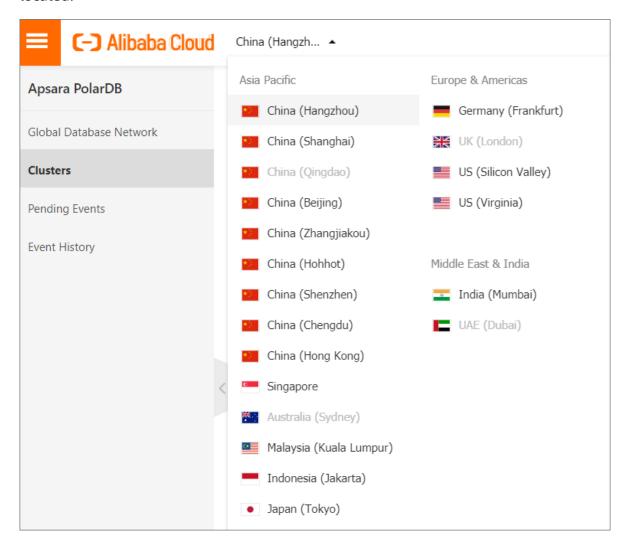

Considerations

An Apsara PolarDB cluster may be disconnected for approximately 30 seconds during switchover. We recommend that you perform the switchover during off-peak hours and make sure that your application can automatically reconnect to the Apsara PolarDB cluster.

Manual switchover

1. Log on to the PolarDB console.

2. In the upper-left corner of the page, select the region where the PolarDB cluster is located.

- **3.** Find the target cluster and click the cluster ID.
- 4. In the upper-right corner of the Node Information section, click Switch Primary Node.

Database Nodes											
Add/Remove Node Change Co	Switch Primary Node										
Node Name	Zone	Status	Role	Specifications	Maximum IOPS	Failover Priority 🔞	Actions				
pi- 24	Hangzhou Zone I	Running	Primary Node	4-Core 16 GB	32000	1	Restart				
pi- 71	Hangzhou Zone I	 Running 	Read-only Node	4-Core 16 GB	32000	1	Restart				

 In the Switch Primary Node dialog box that appears, select a new writer node from the New Primary Node drop-down list, and click OK.

Note:

If you do not select a new writer node from the **New Primary Node** drop-down list, the system automatically promotes a reader node with the highest failover priority to the

new writer node. The cluster may be disconnected for approximately 30 seconds during switchover. Make sure that your application can automatically reconnect to the cluster.

Automatic failover between the writer node and reader nodes

An Apsara PolarDB cluster runs in an active-active high-availability architecture. This architecture allows for automatic failovers between the writer node and reader nodes.

Each node of the cluster has a failover priority. This priority determines the probability that the system promotes this node to the writer node if a failover occurs. If multiple nodes have the same failover priority, they all have the same probability of being promoted to the writer node.

The system follows these steps the to promote a reader node to the writer node:

- **1.** Find all reader nodes that can be promoted to the writer node.
- 2. Select one or more reader nodes that have the highest failover priority.
- **3.** If the failover to the first node fails due to network or replication errors, the system tries to switch the workloads to the next available node. The system continues the failover until one of the available nodes is promoted to the writer node.

12.12 Deploy a cluster across zones and change the primary zone

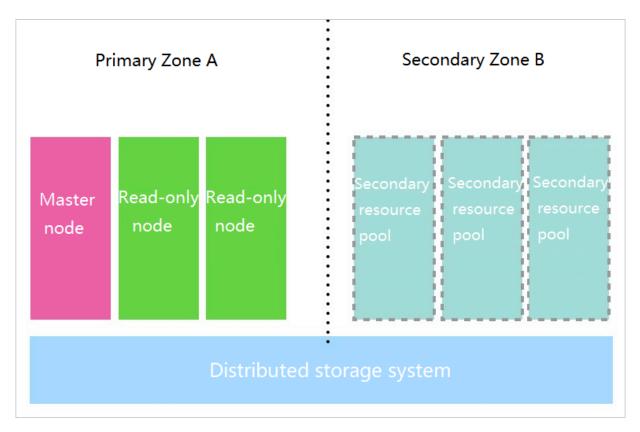

Apsara PolarDB-P allows you to create multi-zone clusters. Compared with single-zone clusters, multi-zone clusters have better disaster recovery capabilities and can withstand breakdowns in data centers. This topic describes how to deploy a cluster across multiple zones and change the primary zone.

Prerequisites

- The region must contain at least two zones.
- The zones must have sufficient computing resources.

Multi-zone architecture

When a multi-zone cluster is deployed, data is distributed across zones. Compute nodes must be deployed in the primary zone. Apsara PolarDB reserves sufficient resources in a secondary zone to ensure a successful failover when the primary zone fails. The following figure shows the multi-zone architecture.

Billing

No additional fee is required for multi-zone deployment.

Note:

You can upgrade a single-zone cluster to a multi-zone cluster for free.

Establish a multi-zone architecture

When the prerequisites are met, a multi-zone cluster is created when you Create a POLARDB for PostgreSQL cluster.

You can also upgrade existing single-zone clusters to multi-zone clusters. This upgrade is automatically achieved by online migration, and does not affect your workloads.

Œ) There may also be a	in hourly billing item in the subscription cluster: two storage spaces: SQL Insight (optional).
	Region	Indonesia (Jakarta) The location is not replaceable after purchase. Please ensure that the POLARB is in the same geographical area as the ECS to be connected, otherwise their intranet cannot communicate directly.
	Create Type	Default Create Type Clone from RDS Migration from RDS Create a brand new POLARDB
Basic	Primary Availability Zone	Jakarta Zone A Jakarta Zone B You can choose to create POLARDB in the same Availability Zone or different Availability Zone as ECS. In areas with two or more Availability Zones, POLARDB will automatically copy data to the Availability Zone. For disaster recovery.

View the zones of a cluster

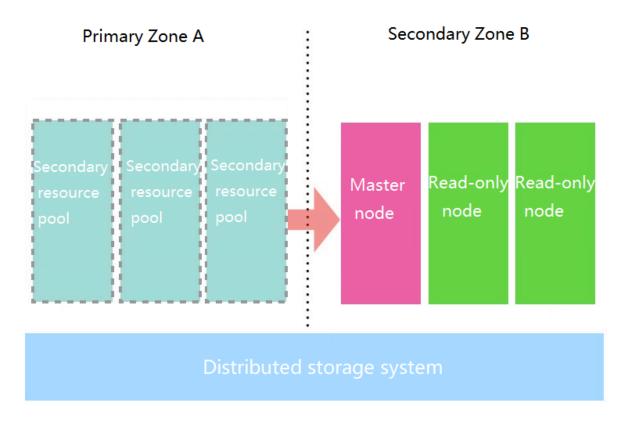

- **1.** Log on to the Apsara PolarDB console.
- **2.** In the upper-left corner of the console, select the region where the target cluster is deployed.
- **3.** Click the ID of the cluster that you want to manage.
- 4. On the **Overview** page, view **Zones**.

Basic Information			
Cluster ID	pc-pc	Cluster Name	pc- Edit
Region	China (Hangzhou)	Zones	Hangzhou Zone G (Primary), Hangzhou Zone I
Compatible Database Engine	MySQL 5.6	Status	Running
VPC	vpc	VSwitch	vsw
Maintenance Window	02:00-03:00 Modify		

Change the primary zone

You can change the primary zone of an Apsara PolarDB cluster. This feature allows you to migrate the compute nodes of a database cluster to a different zone. This is applicable to

scenarios such as disaster recovery or when an Elastic Compute Service (ECS) instance is required to access the cluster in a nearby zone.

- **1.** Log on to the ApsaraDB for PolarDB console.
- **2.** In the upper-left corner of the console, select the region where the cluster is located.
- **3.** Click the ID of the cluster.
- On the Overview page, find the Node Information section and click Migrate Cluster Across Zones.

5. In the Migrate Cluster Across Zones dialog box that appears, select Target Zone and Target VSwitch.

If you migrate the cluster across zone endpoints are not changed, but the I availability of the database service.M	es, all nodes of the cluster are migrated to the target zone. The P addresses in the target zone are used. This migration may rec igrate Cluster Across Zones	luce the
	ОК	Cancel

- If the destination zone is a secondary zone, data migration is not required. Switching to a new secondary zone is fast because only compute nodes are switched. The average time required to migrate a compute node is five minutes. This operation is often performed during disaster recovery drills.
- If the destination zone is not a secondary zone, data must be migrated. This
 migration process may take several hours depending on the data size. Proceed with
 caution. This operation is used to adjust the zones of applications and databases to
 speed up access from a nearby zone.
- 6. Click OK.

Notice:

After the primary zone is changed, the primary endpoints and cluster endpoints remain unchanged, but the VSwitch and IP address may be changed. This operation may disrupt your database service for less than 60 seconds. Proceed with caution.

13 Account management

13.1 Overview

Console accounts

You can use the following accounts to log on to the console:

• Alibaba Cloud account

This account allows flexible control of all your Alibaba Cloud resources and is used for billing purposes. You must create an Alibaba Cloud account before you can purchase any Alibaba Cloud services.

RAM user account

Optional. You can create and manage RAM user accounts in the Resource Access Management (RAM) console to share resources to multiple users. A RAM user account does not have ownership over any resources. Charges incurred are billed to the parent Alibaba Cloud account.

Database cluster accounts

You can use the following accounts to log on to your database cluster. For more information, see Create a database account.

Account type	Description
Privileged account	 You can only create and manage the account in the console. A cluster can have only one privileged account. A privileged account can manage all standard accounts and databases. A privileged account has more permissions, which allows you to perform more management operations. For example, you can grant permissions of querying different tables to different users. The account has all permissions on all databases in the cluster. The account can disconnect any account from the instance.

13.2 Register and log on to an Alibaba Cloud account

Register an Alibaba Cloud account

You can register an Alibaba Cloud account by using one of the following two methods:

• On the Alibaba Cloud website, click **Free Account** in the upper-right corner.

𝚱 Intl - English ∨	다. Cart	Console	Log In
		Free A	Account

• Visit the Alibaba Cloud account registration page.

Log on to your Alibaba Cloud account.

Your Alibaba Cloud account and RAM user account have different logon pages.

• The logon page for Alibaba Cloud accounts is Alibaba Cloud accounts.

Account:		
Email		
Password:	Forgot Password?	
Password		
	Sign In	

• The logon page for RAM users is RAM User Logon.

13.3 Create and authorize a RAM user

This topic describes how to create and authorize a Resource Access Management (RAM) user. You can use your Alibaba Cloud account to access your ApsaraDB for PolarDB resources. If you want to share the resources under your Alibaba Cloud account with other users, create and authorize a RAM user. The RAM user can then be used to access specified resources.

Create a RAM user

- You can use an Alibaba Cloud account or a RAM user to create one or more RAM users. First, log on to the RAM console.
 - Click Alibaba Cloud account Logon to log on with your Alibaba Cloud account.
 - Click RAM User Logon to log on with your RAM user.

Enter the RAM username in the format of RAM username@enterprise alias on the logon page.

- 2. In the left-side navigation pane, click Users under Identities.
- 3. Click Create User.

To create multiple RAM users at a time, click **Add User**.

- 4. Specify the Logon Name and Display Name parameters.
- 5. In the Access Mode section, select Console Password Logon.
- 6. Under Console Password Logon, select Automatically Generate Default Password or Custom Logon Password.
- 7. Under Password Reset, select Required at Next Logon or Not Required.
- 8. Under Multi-factor Authentication, select Not Required.
- 9. Click OK.

Grant permission to a RAM user on the Grants page

- 1. In the left-side navigation pane, click **Grants** under **Permissions**.
- 2. Click Grant Permission.
- 3. Under Principal, enter the username, and click the target RAM user.
- 4. In the **Policy Name** column, select the target policies by clicking the corresponding rows.

Note:

You can click **X** in the section on the right side of the page to delete the selected policy.

- 5. Click **OK**.
- 6. Click Finished.

Grant permission to a RAM user on the Users page

- 1. In the left-side navigation pane, click **Users** under **Identities**.
- 2. In the User Logon Name/Display Name column, find the target RAM user.
- 3. Click Add Permissions. On the page that appears, the principal is automatically filled in.
- 4. In the **Policy Name** column, select the target policies by clicking the corresponding rows.

Note:

You can click **X** in the section on the right side of the page to delete the selected policy.

5. Click OK.

6. Click Finished.

Log on as a RAM user

Prerequisites: You must complete the preceding authorization procedures.

You can log on as a RAM user at the following addresses:

• Universal logon address: RAM User Logon.

If you log on at the universal logon address, you must enter the RAM username and company alias manually. The address format is RAM username@company alias.

• Dedicated logon address: You can view the logon address dedicated to your RAM users in the RAM console.

RAM	F	RAM / Overview
Overview		My Accounts
Identities	~	Users
Groups		13/1000
Users		
Settings		Security Check
SSO		> Enable MFA for Root Account
Permissions	~	> No AK for Root Account
Grants		> Create RAM User Accounts for Daily Work
Policies		> Create Groups and Grant Permissions
RAM Roles		> Customize Policies
	<	> Enable MFA for RAM Users

The system will enter your company alias automatically if you log on using this dedicated address. You only need to enter the RAM username.

More actions

You can also add a RAM user to a group, assign roles to a RAM user, and authorize a user group or roles. For more information, see RAM User Guide.

13.4 Create a database account

This topic describes how to create a database account and reset permissions of the account.

POLARDB for PostgreSQL supports only privileged accounts and allows you to manage the accounts in the console.

Account	Description
type	
Privileged account	 You can only create and manage the account in the console. A cluster can have only one privileged account. A privileged account can manage all standard accounts and databases. A privileged account has more permissions, which allows you to perform more management operations. For example, you can grant permissions of querying different tables to different users. The account has all permissions on all databases in the cluster. The account can disconnect any account from the instance.

Create a privileged account

- **1.** Log on to the ApsaraDB for POLARDB console.
- **2.** Find the target cluster and click the cluster ID.
- **3.** In the left-side navigation pane, click **Accounts**.
- 4. Click Create Account.
- **5.** In the dialog box that appears, configure the following parameters.

Parameter	Description
Account Name	 Enter the account name. The requirements are as follows: It must start with a lowercase letter and end with a letter or digit. It can contain lowercase letters, digits, and underscores (_). It must be 2 to 16 characters in length. It cannot be system reserved usernames, such as root and admin.
Account Type	Select Privileged Account .

Parameter	Description	
Password	Enter the password of the privileged account. The requirements are as follows:	
	 The password must contain at least three of the following character types: uppercase letters, lowercase letters, digits, and special characters. The password must be 8 to 32 characters in length. Special characters include ! @ # \$ % ^ & * () _ + - = 	
Confirm Password	Enter the password again.	
Description	Enter related information about the account for account management. The requirements are as follows:	
	 It cannot start with http:// or https://. The description must start with an uppercase or lowercase letter. The description can contain uppercase or lowercase letters, digits, underscores (_), and hyphens (-). The description must be 2 to 256 characters in length. 	

Reset permissions of a privileged account

If the privileged account of a POLARDB for PostgreSQL cluster encounters a problem, for example, permissions are unexpectedly revoked, you can recover the account by resetting the account permissions.

- **1.** Log on to the ApsaraDB for POLARDB console.
- **2.** Find the target cluster and click the cluster ID.
- **3.** In the left-side navigation pane, click **Accounts**.
- 4. Click Reset Permissions to the right of Privileged Account.
- **5.** In the dialog box that appears, enter the password of the privileged account to reset permissions.

Next step

View connection endpoints.

14 Databases

This topic describes how to create and delete PolarDB-P database.

Create a database

- **1.** Log on to the Apsara PolarDB console.
- **2.** In the upper-left corner of the console, select the region where the target cluster resides.
- **3.** Find the target cluster and click its ID.
- 4. In the left-side navigation pane, choose Settings and Management > Databases.

5. Click Create Database.

Create Database			
* Database Name			0/64
	The name cannot exceed 64 characters in length and can contain lowercase letters, digits, hyphens (-), and underscores (_). It must start with a letter and end with a letter or digit.		
* Database Owner	Select	~	Create Account
* Supported Character Set	UTF8	~	
* Collate	С	~	
* Ctype	С	\sim	
Description			
			0/256
	OK Can	cel	

6. Set the following parameters on the buy page.

Parameter	Description	
Database Name	 The name of the database must start with a letter and end with a letter or digit. The name of the database can contain lowercase letters, digits, underscores (_), and hyphens (-). The database name must be 2 to 64 characters in length. Each database name in an instance must be unique. 	
Database owner	The database owner, who has all permissions on the database.	
Supported Character Set	The character set supported by the database. Default value: UTF8. If you want to use a different character set, select the required character set from the drop-down list.	
Collate	The sorting rules of strings.	
Ctype	The type of characters.	
Description	 Enter the remarks of the database to facilitate subsequent database management. The password must meet the following requirements: It cannot start with http:// or https://. The description must start with an uppercase or lowercase letter. The description can contain uppercase or lowercase letters, digits, underscores (_), and hyphens (-). It must be 2 to 256 characters in length. 	

7. Click **OK**.

Delete a database

- **1.** Log on to the Apsara PolarDB console.
- **2.** In the upper-left corner of the console, select the region where the target cluster resides.
- **3.** Find the target cluster and click its ID.
- **4.** In the left-side navigation pane, choose **Settings and Management > Databases**.
- **5.** Find the target database. Click **delete**.
- 6. In the message that appears, click **OK**.

15 Backup and restoration

15.1 Back up data

This topic describes how to enable PolarDB-P to automatically create backups at specified intervals or manually create backups to prevent data loss. PolarDB-P also allows you to retain backups of a cluster when you delete the cluster.

Features

PolarDB allows you to retain backups for long-term use. You can set the backup feature to automatically retain backups of a cluster when you delete the cluster. This can avoid data loss caused by user errors.

Level-1 backups are created by saving Redirect-on-Write (ROW) snapshots. The system does not replicate a data block when it saves the data block to a snapshot. When a data block is modified, the system saves one of the former versions of the data block to a snapshot, and creates a new data block that is redirected by the original data block. Therefore, you can disregard the size of your database storage and create backups within a few seconds.

The log backup feature creates backups by updating Redo logs to Object Storage Service (OSS) in parallel. Based on a full data backup (snapshot) and Redo logs, you can restore an Apsara PolarDB cluster to a time point. This is known as Point-In-Time Recovery (PITR).

The backup and restoration features of Apsara PolarDB clusters both support multithreaded parallel processing to improve efficiency. A level-1 backup (snapshot) can be restored or cloned at a rate of 1 TB every 40 minutes. If you perform a PITR, you must first consider the amount of time that is required to query Redo logs. Redo logs are queried at a rate of 1 GB every 20 seconds to 1 GB every 70 seconds. The total restoration duration is the sum of the snapshot restoration time and the Redo logs query time.

🔒 Warning:

If you want to disable the backup feature, you can submit a ticketto request technical support. However, after you disable this feature, you must assume the risks that may arise. For example, data loss may occur due to user errors.

Pricing

The backup and restore features of Apsara PolarBD are free of charge. Only storage fees are charged. Fees are calculated based on the storage consumed by backups (cluster and log data) and the amount of time that the backups have been retained.

Note:

Starting at 10:00 am on June 10, 2020 (Beijing Time), Alibaba Cloud begins charging for the backup feature of Apsara PolarBD.For more information, see #unique_74.

Table	15-1:	Pricing
-------	-------	---------

Region	Level-1 backup	Level-2 backup	Log backup
Mainland China	USD 0.000464/GB/ hour	USD 0.0000325/GB/ hour	USD 0.0000325/GB/ hour
China (Hong Kong) and regions outside China	USD 0.000650/GB/ hour	USD 0.0000455/GB/ hour	USD 0.0000455/GB/ hour

Billing methods

Backup type	Free quota	Billing method
Level-1 backup	Database storage usage × 50%	Storage fee per hour = (The total physical storage of level-1 backups - Free quota) × Unit price per hour
	To check the database storage usage, log on to the Apsara for PolarDB console, and click the cluster name to navigate to the Overview page.	 You can use level-1 backups for free if the physical storage of the level-1 backups is less than 50% of database storage usage. For more information about the unit price per hour, see Table 15-1: Pricing. Section 1 in the following figure displays the total physical storage of the level-1 backups. Section 2 displays the total logical storage of the level-1 backups. We we we were an an
Level-2 backup	None	Storage fee per hour = The total physical storage of level-2 backups × Unit price per hour For example: The total physical storage of level-2 backups is 1,000 GB. The storage fee per hour is USD 0 .21. The fee is calculated based on the following formula: 1,000 GB × USD 0.0000325 = USD 0.0325

Backup type	Free quota	Billing method
Log backup	100 GB	Storage fee per hour = (The total physical storage of log backups - 100 GB) × Unit price per hour
		For example: The total physical storage of log backups is 1,000 GB. The storage fee per hour is USD 0.189.
		The fee is calculated based on the following formula: (1,000 GB - 100 GB) × USD 0.0000325 = USD 0.02925

Backup types

Backup type	Description						
Level-1 backup (data	Level-1 backups are stored on a distributed storage cluster. Level-1 backups are fast to create and restore. However, the costs are high.						
backup)	Apsara PolarDB periodically backs up your data by creating Redirect-o Write (ROW) snapshots. The system does not replicate a data block wh it saves the data block to a snapshot. When a data block is modified, t system saves one of the former versions of the data block to a snapsho and creates a new data block that is redirected by the original data blo Therefore, you can disregard the size of your database storage and cre backups within 30 seconds. The retention period for level-1 backups is from 7 to 14 days. To check the total physical storage of level-1 backups, follow the steps shown in the following figure.						
	Overview Settings and Management Whitelists Security Management Accounts Databases Backup and Restore Parameters Diagnostics and Optimization ~	Create Backu		3	Up SQL Files and B		
	Log and Audit V		Jun 3, 2020, 00:21:20	Jun 3, 2020, 00:21:35	Completed		

Backup type	Description
Level-2 backup (data backup)	Level-2 backups refer to level-1 backups that are compressed and then stored in local storage media. Level-2 backups are slower to restore compared with level-1 backups but the costs are lower.
	The retention period for level-2 backups is from 30 to 7,300 days. You can enable the feature.
	Note:
	 By default, the level-2 backup feature is disabled. If you enable this feature, expired level-1 backups will be transferred to a local storage medium and stored as level-2 backups. The backups are transferred at a rate of approximately 150 MB/s. If the current backup transfer task is not finished at the specified time, the system continues the ongoing backup transfer and skips other transfer tasks. For example, you can allow the system to create level-2 backups at 01:00 (UTC+8). Level-1 Backup A is expired at 01:00 (UTC+8), and transferred to a local storage medium as a level-2 backup. Level -1 Backup A stores a large amount of data. As a result, the system continues the transfer that is not finished at 01:00 (UTC+8) the next day . Level-1 Backup B scheduled for transfer is expired and then deleted.
Log backup	A log backup stores the Redo log of a database for point-in-time recovery (PITR). Using log backups can avoid data loss caused by user errors.
	The retention period for log backups is from 7 to 7,300 days. You can also enable the feature to store data permanently.

Backup methods

Backup method	Description
System backup (Auto)	 By default, automatic backup is performed once a day. You can configure the start time and backup cycle for automatic backup. For more information, see Configure automatic backup. Automatically created backup files cannot be deleted.
	Note: To ensure data security, automatic backup must be performed at least twice a week.

Backup method	Description
Manual backup	 You can manually back up data at any time. You can create up to three backups for a cluster. For more information, see Manually create a backup. Manually created backup files can be deleted.

Configure automatic backup

- **1.** Login ApsaraDB for PolarDB console.
- **2.** In the upper-left corner of the console, select the region where the cluster is located.
- **3.** Find the target cluster and click the cluster ID.
- 4. In the left-side navigation pane, choose Settings and Management > Backup and

Restore.

5. Click Backup Settings.

Settings and Manag	Create Backup Point-in-time Restore Backup Setting	Jun 13, 2019	- Aug 13, 2019 📋

	Retain Last Automatic Backup Permanently						
 Delete All Backups Immediately 							
	OK Cancel						

Parameter	Description
Backup Method	The default value Snapshot Backup is used and cannot be changed.
Backup Cycle	Set the backup cycle.
	Note: To ensure data security, automatic backup must be performed at least twice a week.
Start Time	Set the start time for automatic backup.
Level-1 Backups	Set the retention period for level-1 backups.
Retained For	Note: The retention period for level-1 backups is from 7 to 14 days.

Parameter	Description
Level-2 Backup	Enable or disable level-2 backup.
	Note: By default, level-2 backup is disabled.
Level-2 Backups	Set the retention period for level-2 backups.
Retained For	 Note: The retention period for level-2 backups is from 30 to 7,300 days. To store level-2 backups permanently, you can select Retained Before Cluster Is Deleted. Then, you cannot set the retention period.
Log Backups Retained For	Set the retention period for log backups.
	 Note: The retention period for log backups is from 7 to 7,300 days. To save log backups permanently, you can select Retained Before Cluster Is Deleted. Then, you cannot set the retention period.
When Cluster Is Deleted	Set the backup retention policy that applies when you delete a cluster.
	• Retain All Backups Permanently : saves all backups when you delete a cluster.
	Retain Last Automatic Backup Permanently: saves the latest backup when you delete a cluster.
	 Delete All Backups Immediately: does not save any backup when you delete a cluster.
	Note:
	 If you choose the Retain All Backups PermanentlyorRetain Last Automatic Backup Permanently policy, the system will run an automatic backup task to save all data when you delete a cluster. After you delete a cluster, level-1 backups will be automatically archived to level-2 backups. You can go to the Cluster Recycle page to view stored backups. For more information, see #unique_75.

7. Click **OK**.

Manually create a backup

- **1.** Login ApsaraDB for PolarDB console.
- **2.** In the upper-left corner of the console, select the region where the cluster is located.
- **3.** Find the target cluster and click the cluster ID.
- In the left-side navigation pane, choose Settings and Management > Backup and Restore.
- 5. On the Backups tab, click Create Backup.

6. In the Create Backup message that appears, click OK.

Note:	
You can create up to three backups for a cluster.	

Restore data

For more information, see Restore data.

FAQ

• Does the total physical storage of level-1 backups equal the sum of all backups?

The total physical storage of level-1 backups does not equal the sum of all backups. The total physical storage of level-1 backups is displayed in the ① section, as shown in the following figure.

Backups	Logs										5 •
Database Backu	Database Backup (DBS) provides the binary log backup feature to meet the needs of geo-redundancy and data archiving. It ensures the readability of data replications. Learn More

Backup Set ID	Start Time	End Time	Status	Consistent Snapshot Time 😮	Backup Method	Backup Type	Backup Set Size 🕜	Storage Location	Valid	Backup Policy	Actions
and the second sec	Jun 4, 2020, 00:21:41	Jun 4, 2020, 00:21:51	Completed	Jun 4, 2020, 00:21:44	Snapshot Backup	Full Backup	4.31 GB	Level-1 Backup	Yes	System Backup	Restore to New Cluster Delete
*****	Jun 3, 2020, 00:21:20	Jun 3, 2020, 00:21:35	Completed	Jun 3, 2020, 00:21:22	Snapshot Backup	Full Backup	4.31 GB	Level-1 Backup	Yes	System Backup	Restore to New Cluster Delete

• Why is the total physical storage of level-1 backups smaller than the size of a single backup?

Level-1 backups in Apsara PolarDB are measured by using two methods: the physical storage of all backups and the logical storage of each backup. Apsara PolarDB uses snapshot chains to store level-1 backups. Each data block is replicated only once. Therefore, the physical storage of all level-1 backups is smaller than the total logical storage of all level-1 backups, or sometimes even smaller than the logical storage of a single backup.

• How are backups in Apsara PolarDB backup billed?

Storage fees are charged for level-1 backups, level-2 backups, and log backups. By default, level-1 backup and log backup are enabled, but level-2 backup is disabled. Alibaba Cloud also offers free storage for level-1 backups and log backups.

• What is the billing method of level-1 backups?

Storage fee per hour = (Total physical storage of level-1 backups - Database storage usage x 50%) x Unit price per hour. For example, the total physical storage of level-1 backups of an Apsara PolarDB cluster is 700 GB and the database storage usage is 1,000 GB. Then, the storage fee per hour is calculated as (700 GB - 500 GB) × USD 0.000464/GB = USD 0.0928.

• Can I use a storage plan to deduct the storage fee?

No, a storage plan can only be used to deduct storage fees incurred by the stored data. It is not applicable to backups.

АРІ	Description
#unique_77	Creates a full snapshot for a specified Apsara PolarDB cluster.
#unique_78	Queries the backup information of a specified Apsara PolarDB cluster.
#unique_79	Deletes the backups of an Apsara PolarDB cluster.
#unique_80	Queries the automatic backup policy of a specified Apsara PolarDB cluster.
#unique_81	Modifies the automatic backup policy of a specified Apsara PolarDB cluster.

Related operations

15.2 Restore data

PolarDB for PostgreSQL supports Restore by backup set (snapshot) to restore historical data to a new cluster.

📋 Note:

The restored cluster contains the data and account information of the original cluster, but does not contain the parameter settings of the original cluster.

Restore data from a backup set (snapshot)

- **1.** Log on to the ApsaraDB for PolarDB console.
- 2. Select the region where the cluster resides.
- **3.** Find the target cluster and click the cluster ID.
- In the left-side navigation pane, choose Settings and Management > Backup and Restore.
- **5.** Find the target backup set (snapshot) and click **Restore** in the Actions column. In the dialog box that appears, click **OK**.
- 6. On the page that appears, select a billing method for the new cluster:
 - Subscription: An upfront payment must be made for each new compute cluster (contains a primary node and a read-only node by default). The storage occupied by the new cluster is billed on an hourly basis based on the actual data volume. The payment will be deducted from your Alibaba Cloud account on an hourly basis.
 Subscription is more cost-effective for long term use. You can save more with longer subscription periods.
 - Pay-As-You-Go: For the new cluster created, you do not need to pay any subscription fee for a compute cluster in advance. The compute cluster is billed on an hourly basis. The storage occupied by the new cluster is billed on an hourly basis based on the actual data volume. The payment will be deducted from your Alibaba Cloud account on an hourly basis. The Pay-As-You-Go method is most suitable for temporary applications, as you can release the cluster as soon as you do not need it anymore, saving costs.

- **7.** Configure the following parameters:
 - Clone Source Type: Select Backup Set.
 - **Clone Source Backup Set**: Confirm that the backup set is the one that you want to restore from.
 - **Region**: Use the default setting. It is the same as the region of the original cluster.
 - Primary Availability Zone: Use the default setting.
 - **Network Type**: Use the default setting.
 - **VPC** and **VSwitch**: The default settings are recommended, namely, the VPC and VSwitch of the original cluster.
 - **Database Engine**: Use the default setting.
 - **Node Specification**: Clusters with different specifications have different storage capacity and performance. For more information, see Node specifications.
 - **Number of Nodes**: Use the default setting. By default, the system will create a readonly node with the same specifications as the primary node.
 - **Cluster Name**: The system will automatically create a name for your cluster if you leave it blank. You can rename the cluster after it is created.
 - **Purchase Plan**: Set this parameter if you create a subscription cluster.
 - **Number**: The default value is 1, which cannot be modified.
- **8.** Read the **ApsaraDB for PolarDB Agreement of Service**, select the check box to agree to it, and then complete the payment.

15.3 Backup FAQ

This topic answers frequently asked questions about the backup feature of PolarDB for MySQL.

• Does the total physical storage of level-1 backups equal the sum of all backups?

The total physical storage of level-1 backups does not equal the sum of all backups. The total physical storage of level-1 backups is displayed in the ① section, as shown in the following figure.

Backups	Logs										5
Database Backu	p (DBS) provides the	e binary log backup fea	ature to meet the ne	eds of geo-redundancy and	d data archiving. I	t ensures the re	adability of data re	eplications. Learn	More

• Why is the total physical storage of level-1 backups smaller than the size of a single backup?

Level-1 backups in Apsara PolarDB are measured by using two methods: the physical storage of all backups and the logical storage of each backup. Apsara PolarDB uses snapshot chains to store level-1 backups. Each data block is replicated only once. Therefore, the physical storage of all level-1 backups is smaller than the total logical storage of all level-1 backups, or sometimes even smaller than the logical storage of a single backup.

• How are backups in Apsara PolarDB backup billed?

Storage fees are charged for level-1 backups, level-2 backups, and log backups. By default, level-1 backup and log backup are enabled, but level-2 backup is disabled. Alibaba Cloud also offers free storage for level-1 backups and log backups.

• What is the billing method of level-1 backups?

Storage fee per hour = (Total physical storage of level-1 backups - Database storage usage x 50%) x Unit price per hour. For example, the total physical storage of level-1 backups of an Apsara PolarDB cluster is 700 GB and the database storage usage is 1,000 GB. Then, the storage fee per hour is calculated as (700 GB - 500 GB) × USD 0.000464/GB = USD 0.0928.

• Can I use a storage plan to deduct the storage fee?

No, a storage plan can only be used to deduct storage fees incurred by the stored data. It is not applicable to backups.

16 Data Security and Encryption

16.1 Configure SSL encryption

This topic describes how to enhance endpoint security. You can enable Secure Sockets Layer (SSL) encryption and install SSL certificates issued by certificate authorities (CAs) on the necessary application services. SSL is used on the transport layer to encrypt network connections and enhance the security and integrity of communication data. However, SSL also increases the response time.

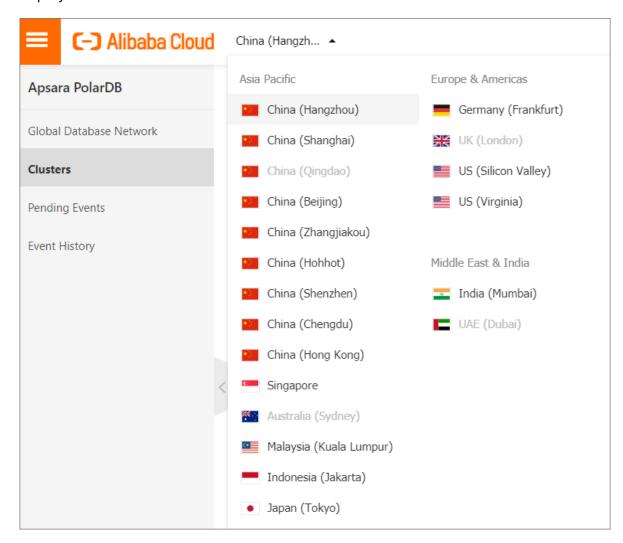

Precautions

- The SSL certificate is valid for one year. Renew the validity period of the certificate, and then download and configure the certificate again. Otherwise, clients that use encrypted connections cannot connect to your databases. For more information, see Renew the validity period of a certificate.
- SSL encryption may cause a significant increase in CPU usage. We recommend that you
 enable SSL encryption only when you want to encrypt connections from an external
 network. In most cases, internal endpoints do not require SSL encryption.
- After you disable SSL encryption for a cluster, the cluster will be restarted. Proceed with caution.

Enable SSL encryption and download a certificate

1. Log on to the Apsara PolarDB console.

2. In the upper-left corner of the page, select the region where the target cluster is deployed.

- **3.** Find the target cluster and click the cluster ID.
- In the left-side navigation pane, choose Settings and Management > Security
 Management.

5. On the SSL Settings tab, click the switch on the right of SSL to enable SSL encryption.

Overview	SSL Settings TDE S	ettings			
Settings and Management 🔷					
Whitelists	SSL	Disabled			
Security Management	SSL Certificate Expired At				
	SSL Certificate Status	Invalid			
Accounts	Download Certificate				
Databases					

- 6. In the **Configure SSL** dialog box, click **OK**.
- 7. After the SSL status changes to **Enabled**, click **Download Certificate**.

SSL Settings TDE Se	ettings
SSL	Enabled Update Validity Period
SSL Certificate Expired At	Jun 3, 2021, 11:29:37
SSL Certificate Status	Valid
Download Certificate	

The downloaded package contains three files:

- p7b file: used to import CA certificates to the Windows system.
- pem file: used to import CA certificates to other operating systems or applications.
- jks file: stores truststore certificates in Java. The password is apsaradb. It is used to import the CA certificate chain to Java programs.

When the jks file is used in Java, you must modify the default JDK security configuration in JDK 7 and JDK 8. Open the jre/lib/security/java.security file on the server that is connected to Apsara PolarDB and modify the following configurations:

jdk.tls.disabledAlgorithms=SSLv3, RC4, DH keySize < 224 jdk.certpath.disabledAlgorithms=MD2, RSA keySize < 1024

If you do not modify the JDK security configuration, the following error will be returned. Other similar errors are also caused by Java security configurations.

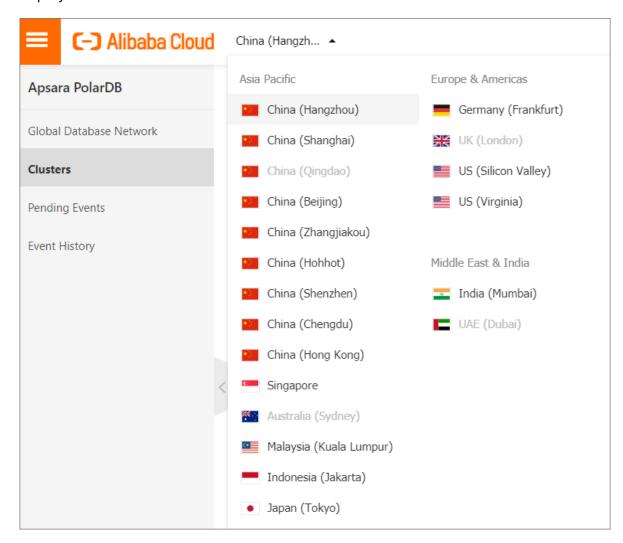

javax.net.ssl.SSLHandshakeException: DHPublicKey does not comply to algorithm constraints

Renew the validity period of a certificate

If you have modified the SSL endpoint or the certificate validity is about to expire, you must renew the validity period of the certificate. This section describes how to renew the validity period of a certificate.

1. Log on to the Apsara PolarDB console.

2. In the upper-left corner of the page, select the region where the target cluster is deployed.

- **3.** Find the target cluster and click the cluster ID.
- 4. In the left-side navigation pane, choose Settings and Management > Security Management.

5. On the SSL Settings tab, click Update Validity Period.

SSL Settings	TDE Se	ettings		
SSL			Enabled	Update Validity Period
SSL Certificate Exp	pired At	Jun 3, 20	21, 11:29:3	7
SSL Certificate Sta	tus	Valid		
Download Certific	ate			

6. In the Configure SSL dialog box, click OK.

After you renew the validity period of the certificate, the cluster will be restarted. Proceed with caution.

7. After the validity period of the certificate is renewed, you must download and configure the certificate again.

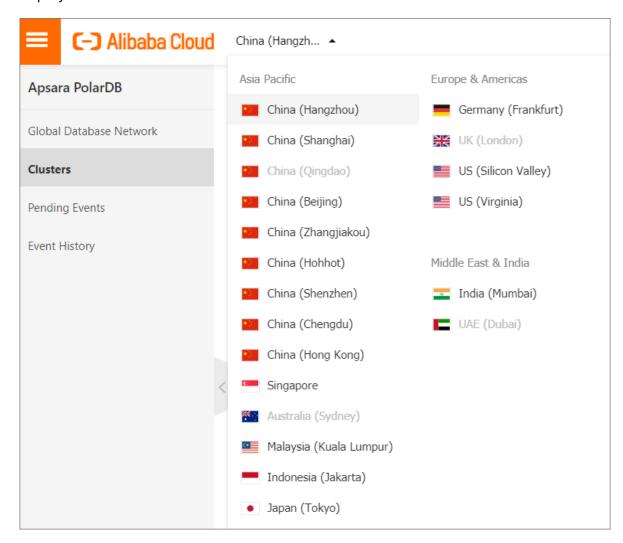

For more information about how to download a certificate, see Step 7 in Enable SSL encryption and download a certificate.

Disable SSL encryption

- After you disable SSL encryption for a cluster, the cluster will be restarted. We recommend that you perform this operation during off-peak hours.
- After SSL encryption is disabled, the performance of your database is increased but its security is compromised. We recommend that you disable SSL encryption only in secure environments.
- **1.** Log on to the Apsara PolarDB console.

2. In the upper-left corner of the page, select the region where the target cluster is deployed.

- **3.** Find the target cluster and click the cluster ID.
- 4. In the left-side navigation pane, choose Settings and Management > Security Management.

5. On the SSL Settings tab, click the switch on the right of SSL to disable SSL encryption.

SSL Settings TDE Se	ettings		
SSL SSL Certificate Expired At	Enabled Upda	te Validity Period	
SSL Certificate Status Download Certificate	Valid	Disable SSL	×
		Are you sure you want to	disable SSL?
		ок	Cancel

6. In the Configure SSL dialog box, click OK.

FAQ

Q: What happens if I do not renew an expired SSL certificate? Will my instance malfunction or the security of my data be compromised?

A: If you do not renew the SSL certificate after it expired, your instance can still run and your data security is not compromised. However, the applications that use encrypted connections to communicate with your instance are disconnected.

#unique_89	Queries SSL settings of an Apsara PolarDB cluster.
#unique_90	Enables or disables SSL encryption, or updates the SSL certificate issued by a CA for an Apsara PolarDB cluster.

16.2 Set TDE

Apsara PolarDB-P supports the Transparent Data Encryption (TDE) feature. TDE performs real-time I/O encryption and decryption on data files. Data can be encrypted before being written to a disk and decrypted when read into memory. TDE does not increase the size of data files. Developers can use TDE without making changes to applications.

Prerequisites

- The version of the cluster is Apsara PolarDB-P.
- Key Management Service (KMS) is activated. If KMS has not been activated, you can activate KMS for free.

Context

TDE performs data-at-rest encryption at the database layer. This prevents potential attackers bypassing the database to read sensitive information from storage. TDE can encrypt sensitive data within tablespaces and data stored in disks and backups. TDE also automatically decrypts data to plaintext for applications and users that have passed the database authentication. OS and unauthorized users are not allowed to access the encrypted data in plaintext form.

TDE keys of Apsara PolarDB-P are created and managed by KMS. Apsara PolarDB-P does not provide keys and certificates required for encryption. You can use the keys automatica lly generated by Alibaba Cloud, or use your own materials to generate data keys and then authorize Apsara PolarDB to use them.

Precautions

- You cannot disable TDE after it is enabled.
- You can only enable TDE when you create a cluster.
- In I/O bound workload cases, TDE may affect database performance after it is enabled.
- When you use an existing custom key, please pay close attention to the following:
 - If you disable a key, set a key deletion plan, or delete the key material, the key becomes unavailable.
 - If you revoke the authorization to an Apsara PolarDB cluster, the cluster becomes unavailable after it is restarted.
 - You must use your Alibaba Cloud account or an account with the AliyunSTSA ssumeRoleAccess permission.

Procedure

- **1.** Login ApsaraDB for PolarDB console.
- **2.** In the upper-left corner of the console, select the region where the cluster is located.
- **3.** On the **Clusters** page, click **Create Cluster**.

4. On the Apsara PolarDB Subscription page, specify Apsara PolarDB purchase

information, and select **Enable TDE**.

	ote:
For more	information about the buy page, see CreateDBCluster.
Enable TDE	Disable TDE Enable TDE
	TDE cannot be turned off after it is turned on , TDE depends on KMS service, click enable KMS service for free after enabling TDE encryption, PolarDB will encrypt cluster data files, which is transparent to business access and will have 5% ~ 10% performance loss.

- 5. Click **Buy Now** on the right side of the page.
- 6. On the Confirm Order page, confirm your order information, read and select Apsara

PolarDB Subscription Agreement of Service, and then click **Pay**.

Note:

After the payment is complete, the cluster is created within about 10 minutes.

View the TDE status

- **1.** Login ApsaraDB for PolarDB console.
- 2. In the upper-left corner of the console, select the region where the cluster is located.
- **3.** Find the target cluster and click the cluster ID.
- In the left-side navigation pane, select Configuration and Management > Security
 Management.
- 5. On the TDE Settings tab, view TDE Status.

SSL Settings	TDE Settings
TDE Status	Enabled (This feature cannot be disabled after you enable it.)

Switch to a custom key

 In the left-side navigation pane, select Configuration and Management > Security Management. **2.** On the tab, click on the right side of **TDE Status**.

	SSL Settings	TDE Settings	
TDE Status Enabled (This feature cannot be disabled after you enable it.) Switch to Custom Key	TDE Status	E	abled (This feature cannot be disabled after you enable it.) Switch to Custom Key

3. In the **Configure TDE** dialog box, select **Use Existing Custom Key**.

Note:

If you do not have a custom key, click **Create Custom Key** to create a key in the KMS console and import the key material. For more information, see KMS.

Configure TDE	×
O Use Default Key of KMS	
Use Existing Custom Key	
You can also use another custom key.Create Custom Key

	OK Cancel

4. Click **OK**.

FAQ

• Q: Can common database tools, such as Navicat, be used normally after TDE is enabled?

A: Yes.

• Q: Why is data still in plaintext after encryption?

A: After TDE is enabled, the stored data is encrypted. When data is queried, it is decrypted and read to the memory. It is displayed in plaintext.

	Note: The DBType parameter must be set to PostgreSQL or Oracle.

17 Diagnostics and optimization

17.1 Performance monitoring and alert configuration

The ApsaraDB for PolarDB console provides a variety of performance metrics for you to monitor the status of your instances.

Performance monitoring

- 1. Log on to the ApsaraDB for PolarDB console.
- 2. Select a region.
- **3.** Find the target cluster and click the **cluster ID** in the **Cluster Name** column.
- **4.** In the left-side navigation pane, choose **Diagnostics and Optimization** > **Monitoring**.
- **5.** You can view the performance information of a **Cluster** or **Node** as needed. For more information, see Metric description.
 - To monitor cluster performance, click the **Cluster** tab and set the monitoring time period. Click **OK**.
 - To monitor node performance, click the **Node** tab, select a node from the **Select Node** drop-down list, and set the monitoring time period. Click **OK**.

Note:

You can click **More** at the lower part of the **Node** tab to view more metrics.

Category	Metric	Description
Cluster	Storage	Displays the usage of data space, log space, temporary space, and WAL log space.
	CPU	Displays the CPU usage of each node.
	Memory	Displays the memory usage of each node.
Node	TPS	Displays the number of transactions per second of the selected node, including the number of committed transactions per second, deadlocked transactions per second, and rollback transactions per second.
	CPU	Displays the CPU usage of the selected node.
	Memory	Displays the memory usage of the selected node.

Metric description

Category	Metric	Description
	Connections	Displays the total number of current connections, active connections, and idle connections of the selected node.
	Scanned Rows	Displays the numbers of rows inserted, read, updated, deleted, and returned per second of the selected node.
	Maximum Database Age	Displays the difference between the transaction IDs of the oldest and newest transactions in the database.
	I/O Throughput	Displays the total I/O throughput, I/O read throughput, and I/O write throughput of the selected node.
	IOPS	Displays the input/output operations per second (IOPS) of the selected node, including the total IOPS, read IOPS, and write IOPS.
	Cache	Displays the cache reads per second and disk reads per second of the selected node.
	Cache Hit Ratio	Displays the cache hit ratio of the selected node.
	Temporary Files	Displays the number and total size of temporary files on the selected node.

Alert settings

- **1.** Log on to the CloudMonitor console.
- 2. In the left-side navigation pane, choose Alerts > Alert Rules.
- 3. On the Alert Rules page, click Create Alert Rule to go to the Create Alert Rule page.
- **4.** Select **ApsaraDB for PolarDB-PostgreSQL/Oracle** from the **Product** drop-down list and select a resource range from the **Resource Range** drop-down list. Set the alert rule and notification method, and click **Confirm**.

Note:

For more information about alert rules, see **#unique_96**.

17.2 Performance insight

ApsaraDB for PolarDB provides the performance insight feature, which focuses on monitoring the load, analyzing the load, and optimizing the performance of an ApsaraDB for PolarDB cluster. The feature helps you easily evaluate database loads, find the causes for performance problems, and enhance database stability.

Scenarios

Performance insight can be applied in the following scenarios:

• Analyze the cluster metrics

Performance insight helps you monitor the key metrics of an ApsaraDB for PolarDB cluster. It also allows you to check the status and trend of the loads for the cluster. You can identify the sources that generate loads and the distribution of loads within a certain period from the trend charts of key metrics.

• Evaluate database loads

ApsaraDB for PolarDB provides the trend chart of average active sessions (AAS), which alleviates the need to analyze the complicated trend charts of various metrics. AAS trend chart shows the information of all key metrics to help you evaluate the sources that generate loads and cause performance bottlenecks. You can determine the causes for performance bottlenecks, such as high CPU usage, lock-waiting, and I/O latency, and find the corresponding SQL statement that incurs the problem.

Note:

AAS is the number of average active sessions of an ApsaraDB for PolarDB cluster within a certain period. The trends of AAS reflect the changes of the loads for the cluster. In the performance insight feature, AAS is a key metric used to measure the loads for an ApsaraDB for PolarDB cluster.

• Find the sources that cause performance problems

You can analyze the trend chart of AAS and load sources in multiple dimensions to determine whether a performance problem is caused by improper cluster configurations or the database architecture. You can also find the corresponding SQL statement that incurs the performance problem.

Procedure

- **1.** Log on to the ApsaraDB for PolarDB console.
- 2. Select a region.
- **3.** Find the target cluster and click the cluster ID in the **Cluster Name** column.

- 4. In the left-side navigation pane, choose **Diagnostics and Optimization** > **Performance** Insight.
- 5. Select filtering conditions.

Description of the metrics page

Trend charts of key metrics

You can use the trend charts of key metrics to check the load status and resource bottlenecks of an ApsaraDB for PolarDB cluster.

You can select a given time period or specify a custom time period to retrieve the trend charts of key metrics within the corresponding time period.

Trend chart of AAS

After you use the trend charts of key metrics to check the load status, you can identify the load sources.

Note:

max Vcores indicates the maximum number of CPU cores that can be used by an ApsaraDB for PolarDB cluster. The value determines the processing capacity of CPUs in the cluster.

From the real-time trend chart of AAS, you can find the load sources, the time when loads occur, and the trend of loads over a period of time.

Load sources from multiple dimensions

You can learn the trend of the loads for an ApsaraDB for PolarDB cluster by analyzing the trend chart of AAS. You can find the specific SQL statements that cause performance bottlenecks, and the related users, hosts, and databases.

As shown in the lower section of the preceding figure, you can find the SQL statements that affect the loads, and the usage ratio of each statement in a specified AAS.

Performance insight supports six dimensions of AAS. You can switch dimensions by using the drop-down list of **AAS Type** in the upper-right corner of the AAS page.

Туре	Description
SQL	The trends of top 10 SQL statements in your business.
Waits	The trends of wait events within the specified time period.
Users	The trends of logon users.

Туре	Description
Hosts	The trends of hostnames or IP addresses of clients.
Databases	The trends of the databases where your businesses are located.
Status	The trends of active sessions within the specified time period.

18 SQL Explorer

Apsara PolarDB provides the SQL Explorer feature. You can use SQL Explorer for database security auditing and performance diagnostics.

Pricing

- The trial edition of Apsara PolarDB is available for free. In the trial edition, audit logs are retained for only one day. You can query only data that is stored in the retained audit logs. The trial edition does not support advanced features. For example, data cannot be exported, and data integrity cannot be ensured.
- If you want to retain the audit logs for 30 days or longer, you can view the pricing details in #unique_17.

Features

• SQL logging

SQL audit logs record all operations that are performed on databases. You can use audit logs to identify database failures, analyze behaviors, and perform security auditing.

Advanced search

SQL Explorer allows you to search data by database, user, client IP, thread ID, execution duration, or execution status. You can also export and download search results.

19 Plug-ins

19.1 Read and write external data files by using oss_fdw

Alibaba Cloud allows you to use the oss_fdw plug-in to load data in OSS to PolarDB-P databases and write data in PolarDB-P databases to OSS.

oss_fdw parameters

The oss_fdw plug-in uses a method similar to other Foreign Data Wrapper (FDW) interfaces to encapsulate external data stored in OSS. You can use oss_fdw to read data stored in OSS. This process is similar to reading data tables. oss_fdw provides unique parameters to connect and parse file data in OSS.

Note:

- oss_fdw can read and write files of the following types in OSS: TEXT and CSV files as well as gzip-compressed TEXT and CSV files.
- The value of each parameter must be enclosed in double quotation marks (") and cannot contain any unnecessary spaces.

CREATE SERVER parameters

- ossendpoint: the endpoint used to access OSS through the internal network, also known as the host.
- id oss: the ID of your OSS account.
- key oss: the key of your OSS account.
- bucket: the OSS bucket. You must create an OSS account before specifying this parameter.

The following fault tolerance parameters can be used for data import and export. If network connectivity is poor, you can adjust these parameters to guarantee successful import and export.

- oss_connect_timeout: indicates the connection timeout period. Default value: 10. Unit: seconds.
- oss_dns_cache_timeout: indicates the DNS timeout period. Default value: 60. Unit: seconds.

- oss_speed_limit: indicates the minimum data transmission rate. Default value: 1. Unit: Kbit/s.
- oss_speed_time: indicates the maximum period when the data transmission rate is lower than the minimum value. Default value: 15. Unit: seconds.

If the default values of oss_speed_limit and oss_speed_time are used, a timeout error occurs when the transmission rate is smaller than 1 Kbit/s for 15 consecutive seconds.

CREATE FOREIGN TABLE parameters

- filepath: a file name that contains a path in OSS.
 - A file name contains a path but not a bucket name.
 - This parameter matches multiple files in the corresponding path in OSS. You can load multiple files to a database.
 - You can import files named in the format of filepath or filepath.x to a database. The values of x must be consecutive numbers starting from 1.

For example, among the files named filepath, filepath.1, filepath.2, filepath.3, and filepath.5, the first four files are matched and imported. The filepath.5 file is not imported.

- dir: the virtual file directory in OSS.
 - dir must end with a forward slash (/).
 - All files (excluding subfolders and files in subfolders) in the virtual file directory specified by dir will be matched and imported to a database.
- prefix: the prefix of the path name corresponding to the data file. The prefix does not support regular expressions. Only one parameter among prefix, filepath, and dir can be specified at a time because they are mutually exclusive.
- format: the file format, which can only be csv.
- encoding: the file data encoding format. It supports common PostgreSQL encoding formats, such as UTF-8.
- parse_errors: the fault-tolerant parsing mode. If an error occurs during the parsing process, the entire row of data is ignored.
- delimiter: the column delimiter.
- quote: the quote character for files.
- escape: the escape character for files.

- null: sets the column matching a specified string to null. For example, null 'test' is used to set the value of the 'test' column to null.
- force_not_null: sets the value of a column to a non-null value. For example, force_not_ null 'id' is used to set the value of the 'id' column to empty strings.
- compressiontype: specifies the format of the files to be read or written in OSS.
 - none: uncompressed text files. This is the default value.
 - gzip: The files to be read must be gzip compressed.
- compressionlevel: specifies the compression level of the compression format written to OSS. Valid values: 1 to 9. Default value: 6.

Note:

- You must specify filepath and dir in the OPTIONS parameter.
- You must specify either filepath or dir.
- The export mode only supports virtual folders, that is, only dir is supported.

Export mode parameters for CREATE FOREIGN TABLE

- oss_flush_block_size: the buffer size for the data written to OSS at a time. Default value:
 32 MB. Valid values: 1 MB to 128 MB.
- oss_file_max_size: the maximum file size for the data written to OSS (subsequent data is written in another file when the maximum file size is exceeded). Default value: 1024 MB.
 Valid values: 8 MB to 4000 MB.
- num_parallel_worker: the number of parallel compression threads in which the OSS data is written. Valid values: 1 to 8. Default value: 3.

Auxiliary functions

FUNCTION oss_fdw_list_file (relname text, schema text DEFAULT 'public')

- Obtains the name and size of the OSS file that an external table matches.
- The unit of file size is Byte.

select * from oss_fd name	w_list_file('t_oss'); size
oss_test/test.gz.1 oss_test/test.gz.2 oss_test/test.gz.3	739413041

(3 rows)

Auxiliary features

oss_fdw.rds_read_one_file: In read mode, it is used to specify a file to match the external

table. If the file is specified, the external table only matches this file during data import.

Example: set oss_fdw.rds_read_one_file = 'oss_test/example16.csv.1';

oss_fdw example

<pre># Create a plug-in create extension oss_fdw; # Create a server CREATE SERVER ossserver FOREIGN DATA WRAPPER oss_fdw OPTIONS (host 'oss-cn-hangzhou.aliyuncs.com', id 'xxx', key 'xxx', bucket 'mybucket'); # Create an OSS external table CREATE FOREIGN TABLE ossexample (date text, time text, open float, high float, low float, volume int) SERVER ossserver OPTIONS (filepath 'osstest/example.csv', delimiter ', format 'csv', encoding 'utf8', PARSE_ERRORS '100'); # Create a table to load data to create table example (date text, time text, open float, high float, low float, volume int) # Load data from ossexample to example. insert into example select * from ossexample; # Result # oss_fdw estimates the file size in OSS and formulates a query plan correctly. explain insert into example select * from ossexample; QUERY PLAN</pre>
Insert on example (cost=0.001.60 rows=6 width=92) -> Foreign Scan on ossexample (cost=0.001.60 rows=6 width=92) Foreign OssFile: osstest/example.csv.0 Foreign OssFile Size: 728 (4 rows) # Write the data in the example table to OSS. insert into ossexample select * from example; explain insert into ossexample select * from example;
QUERY PLAN Insert on ossexample (cost=0.0016.60 rows=660 width=92)

-> Seq Scan on example (cost=0.00..16.60 rows=660 width=92)

(2 rows)

oss_fdw usage considerations

- oss_fdw is an external table plug-in developed based on the PostgreSQL FOREIGN TABLE framework.
- The data import efficiency is subject to the PolarDB-P cluster resources (CPU, I/O, memory, and MET) and OSS.
- To guarantee data import performance, make sure that PolarDB-P is in the same region as OSS. For more information, see Endpoints.
- If the error "oss endpoint userendpoint not in aliyun white list" is reported during reading of SQL statements for external tables, use the endpoints listed in Regions and endpoints. If the problem persists, submit a ticket.

Error handling

When an import or export error occurs, the log displays the following error information:

- code: the HTTP status code of the request that has failed.
- error_code: the error code returned by OSS.
- error_msg: the error message returned by OSS.
- req_id: the UUID that identifies the request. If you cannot solve the problem, you can seek help from OSS development engineers by providing the req_id.

For more information about error types, see the following references. Timeout errors can be handled using oss_ext parameters.

- OSS help
- •
- OSS error handling
- OSS error response

ID and key encryption

If id and key parameters for CREATE SERVER are not encrypted, executing the select * from pg_foreign_server statement will display the information in plaintext. Your ID and key will be exposed. You can use symmetric encryption to hide the ID and key. Use different keys for different instances to further protect your information. However, to avoid incompatibility with earlier versions, do not add data types as you do in Greenplum.

Encrypted information:

The encrypted information is preceded by the MD5 hash value. The remainder of the total length divided by 8 is 3. Therefore, encryption is not performed again when the exported data is imported. But you cannot create the key and ID preceded by an MD5 hash value.

19.2 Use the pg_pathman plug-in

This topic describes common usage scenarios of the pg_pathman plug-in.

Context

To improve the performance of partitioned tables, the pg_pathman plug-in is introduced

to PolarDB for PostgreSQL. This plug-in enables you to manage partitions and optimize partitioning.

Create the pg_pathman extension

```
test=# create extension pg_pathman;
CREATE EXTENSION
```

View installed extensions

Run the following commands to view installed extensions and the version of the

pg_pathman plug-in.

Upgrade the plug-in

PolarDB for PostgreSQL upgrades the plug-in on a regular basis to provide better database services. To upgrade the plug-in, perform the following steps:

• Upgrade the corresponding cluster to the latest version. You need to submit a ticket to perform the upgrade because this function is in the development phase.

• Execute the following statements to complete the update:

ALTER EXTENSION pg_pathman UPDATE; SET pg_pathman.enable = t;

Features

- Support for hash and range partitioning.
- Support for automatic and manual partition management. In automatic partition
 management, the system uses functions to create partitions and migrate data in primary
 tables to partitions. In manual partition management, you can use functions to attach
 existing tables to partitioned tables or detach tables from partitioned tables.
- Support for several partition fields including custom domains and common data types such as integer, floating point, and date.
- Effective query planning for partitioned tables by using joins and subselects.
- RuntimeAppend and RuntimeMergeAppend custom plan nodes to pick partitions at runtime.
- PartitionFilter: an efficient drop-in replacement for INSERT triggers.
- Automatic partition creation for newly inserted data (only for range partitioning).
- Support for the COPY FROM/TO statement, allowing direct read or write operations on partitions.
- Partition fields update. To update partition fields, you need to add a trigger. If you do
 not need to update partition fields, we recommend that you do not add the trigger to
 avoid negative impacts on performance.
- User-defined callback functions are automatically triggered when partitions are created.
- Non-blocking concurrent table partitioning and automatic data migration from primary tables to partitions in the background.
- Support for postgres_fdw or any Foreign Data Wrappers (FDW) by configuring the pg_pathman.insert_into_fdw=(disabled | postgres | any_fdw) parameter.

Usage

- Views and tables
- Partition management
- Advanced partition management

For more information, see https://github.com/postgrespro/pg_pathman.

Views and tables

The pg_pathman plug-in uses functions to maintain partitioned tables and creates views

for viewing the status of partitioned tables, as described in the following examples:

1. pathman_config

```
CREATE TABLE IF NOT EXISTS pathman_config (
partrel REGCLASS NOT NULL PRIMARY KEY, -- The OID of the primary table.
attname TEXT NOT NULL, -- The column name of the partition.
parttype INTEGER NOT NULL, -- The type of the partition (hash or range).
range_interval TEXT, -- The interval of range partitions.
```

```
CHECK (parttype IN (1, 2)) /* check for allowed part types */ );
```

2. pathman_config_params

CREATE TABLE IF NOT EXISTS pathman_config_params (partrel REGCLASS NOT NULL PRIMARY KEY, -- The OID of the primary table. enable_parent BOOLEAN NOT NULL DEFAULT TRUE, -- Specifies whether to filter the primary table in the optimizer. auto BOOLEAN NOT NULL DEFAULT TRUE, -- Specifies whether to automatically expand partitions that do not exist during INSERT operations. init_callback REGPROCEDURE NOT NULL DEFAULT 0); -- The OID of the callback function when the partition is created.

3. pathman_concurrent_part_tasks

```
-- helper SRF function
CREATE OR REPLACE FUNCTION show concurrent part tasks()
RETURNS TABLE (
  userid
         REGROLE,
  pid
         INT,
  dbid
         OID
         REGCLASS,
  relid
  processed INT,
  status
         TEXT)
AS 'pg pathman', 'show concurrent part tasks internal'
LANGUAGE C STRICT;
```

CREATE OR REPLACE VIEW pathman_concurrent_part_tasks AS SELECT * FROM show_concurrent_part_tasks();

4. pathman_partition_list

-- helper SRF function CREATE OR REPLACE FUNCTION show_partition_list() RETURNS TABLE (parent REGCLASS, partition REGCLASS, parttype INT4, partattr TEXT, range_min TEXT, range_max TEXT) AS 'pg_pathman', 'show_partition_list_internal' LANGUAGE C STRICT;

CREATE OR REPLACE VIEW pathman_partition_list

AS SELECT * FROM show_partition_list();

Partition management

1. Range partitions

Four management functions are used to create range partitions. Two functions are used to specify the start value, interval, and number of partitions. The definition of these two functions are as follows:

REGCLASS, -- The OID of the primary table. create_range_partitions(relation attribute TEXT, -- The column name of the partition. start_value ANYELEMENT, -- The start value. p_interval ANYELEMENT, -- The interval, applicable to any type of partitioned tables. p_count INTEGER DEFAULT NULL, -- The number of partitions. partition data BOOLEAN DEFAULT TRUE) -- Specifies whether to immediately migrate data from the primary table to partitions. We recommend that you call the partition table concurrently() function to run non-blocking data migration. create range partitions(relation REGCLASS, -- The OID of the primary table. TEXT, -- The column name of the partition. attribute start_value ANYELEMENT, -- The start value. p_interval INTERVAL, -- The interval of the interval type, applicable to ingestion-time partitioned tables. p_count INTEGER DEFAULT NULL, -- The number of partitions. partition data BOOLEAN DEFAULT TRUE) -- Specifies whether to immediately migrate data from the primary table to partitions. We recommend that you call the partition table concurrently() function to run non-blocking data migration.

The other two functions are used to specify the start value, end value, and interval. The

definitions are as follows:

create_partitions_from_range(relation REGCLASS, The OID of the primary table. attribute TEXT, The column name of the partition. start_value ANYELEMENT, The start value. end_value ANYELEMENT, The end value. p_interval ANYELEMENT, The interval, applicable to any type of partitioned tables.
partition_data BOOLEAN DEFAULT TRUE) Specifies whether to immediately migrate data from the primary table to partitions. We recommend
that you call the partition_table_concurrently() function to run non-blocking data
migration.
create_partitions_from_range(relation REGCLASS, The OID of the primary table. attribute TEXT, The column name of the partition. start_value ANYELEMENT, The start value. end_value ANYELEMENT, The end value. p_interval INTERVAL, The interval of the interval type, applicable
to ingestion-time partitioned tables.
partition_data BOOLEAN DEFAULT TRUE) Specifies whether to
immediately migrate data from the primary table to partitions. We recommend

that you call the partition_table_concurrently() function to run non-blocking data migration.

Example:

```
Create a primary table that needs to be partitioned.
postgres=# create table part_test(id int, info text, crt_time timestamp not null); -- All
partition columns must contain the NOT NULL constraint.
CREATE TABLE
Insert a large amount of test data to simulate a primary table that already contains
data.
postgres=# insert into part_test select id,md5(random()::text),clock_timestamp() + (id
||' hour')::interval from generate_series(1,10000) t(id);
INSERT 0 10000
postgres=# select * from part test limit 10;
id |
      info | crt_time
----+

(1 row)

postgres=# explain select * from part_test where crt_time = '2016-10-25 00:00:00'::
timestamp;

QUERY PLAN

```
Append (cost=0.00..16.18 rows=1 width=45)

-> Seq Scan on part_test_1 (cost=0.00..16.18 rows=1 width=45)

Filter: (crt_time = '2016-10-25 00:00:00'::timestamp without time zone)

(3 rows)
```

Note:

When using range partitioning, note the following items:

- All partition columns must contain the NOT NULL constraint.
- The number of partitions must be sufficient to cover all existing records.
- Run non-blocking data migration.
- After data migration is completed, disable the primary table.
- 2. Hash partitioning

You can use a management function to create range partitions. You can specify the start

value, interval, and number of partitions, as described in the following examples:

create_hash_partitions(relation REGCLASS, -- The OID of the primary table. attribute TEXT, -- The column name of the partition. partitions_count INTEGER, -- The number of partitions to be created. partition_data BOOLEAN DEFAULT TRUE) -- Specifies whether to immediately migrate data from the primary table to partitions. We recommend that you call the partition_table_concurrently() function to run non-blocking data migration.

Example:

Create a primary table that needs to be partitioned. postgres=# create table part test(id int, info text, crt time timestamp not null); -- All partition columns must contain the NOT NULL constraint. CREATE TABLE Insert a large amount of test data to simulate a primary table that already contains data. postgres=# insert into part test select id,md5(random()::text),clock timestamp() + (id "hour')::interval from generate series(1,10000) t(id); **INSERT 0 10000** postgres=# select * from part_test limit 10; id | info crt time 1 | 29ce4edc70dbfbe78912beb7c4cc95c2 | 2016-10-25 10:47:32.873879 2 e0990a6fb5826409667c9eb150fef386 2016-10-25 11:47:32.874048 3 d25f577a01013925c203910e34470695 2016-10-25 12:47:32.874059 4 501419c3f7c218e562b324a1bebfe0ad 2016-10-25 13:47:32.874065 5 | 5e5e22bdf110d66a5224a657955ba158 | 2016-10-25 14:47:32.87407 6 55d2d4fd5229a6595e0dd56e13d32be4 2016-10-25 15:47:32.874076 7 | 1dfb9a783af55b123c7a888afe1eb950 | 2016-10-25 16:47:32.874081 8 41eeb0bf395a4ab1e08691125ae74bff 2016-10-25 17:47:32.874087 9 83783d69cc4f9bb41a3978fe9e13d7fa 2016-10-25 18:47:32.874092

The data is still in the primary table because it is not migrated. postgres=# select count(*) from only part_test; count
10000 (1 row)
Run non-blocking data migration partition_table_concurrently(relation_REGCLASS, The OID of the primary table. batch_size INTEGER DEFAULT 1000, The number of records to copy from the primary table at a time. sleep_time FLOAT8 DEFAULT 1.0) The time interval between migration attempts if one or more rows in the batch are locked by other queries. pg_pathman waits for the specified time and tries again up to 60 times before quitting
postgres=# select partition_table_concurrently('part_test'::regclass, 10000, 1.0); NOTICE: worker started, you can stop it with the following command: select stop_concurrent_part_task('part_test'); partition_table_concurrently
(1 row)
After the migration, all data is migrated to the partitions, and the primary table is empty. postgres=# select count(*) from only part_test; count
0 (1 row)

After the data is migrated, we recommend that you disable the primary table so that the primary table will not be included in the execution plan. postgres=# select set enable parent('part test'::regclass, false); set_enable_parent (1 row) Query only a single partition. postgres=# explain select * from part test where crt time = '2016-10-25 00:00'::: timestamp; QUERY PLAN Append (cost=0.00..1.91 rows=1 width=45) -> Seq Scan on part_test_122 (cost=0.00..1.91 rows=1 width=45) Filter: (crt time = '2016-10-25 00:00:00'::timestamp without time zone) (3 rows) The constraints on partitions are as follows: pg pathman automatically completes the conversion. For traditional inheritance, expressions similar to select * from part_test where crt_time = '2016-10-25 00:00:00':: timestamp; cannot filter partitions. postgres=# \d+ part_test_122 Table "public.part_test_122" Type | Modifiers | Storage | Stats target | Description Column | -----+----**+**----id |integer info |text |plain | L Ľ | extended | crt_time | timestamp without time zone | not null | plain | Check constraints: pathman_part_test_122_3_check" CHECK (get_hash_part_idx(timestamp_hash(crt_{time}^{+} , 128) = 122) Inherits: part test

Note:

When using hash partitioning, note the following items:

- All partition columns must contain the NOT NULL constraint.
- Run non-blocking data migration.
- After data migration is completed, disable the primary table.
- pg_pathman is not subject to expressions. So the command select * from part_test where crt_time = '2016-10-25 00:00'::timestamp; can also be used for hash partitioning.
- HASH partition columns are not limited to int type columns. The column types are automatically converted by a hash function.

3. Migrate data to a partition

If the data of the primary table is not migrated to partitions when the partitions are

created, the data can be migrated to the partitions by calling a non-blocking migration

function. Run the following commands:

with tmp as (delete from a primary table limit xx nowait returning *) insert into a partition select * from tmp

You can also use select array_agg(ctid) from a primary table limit xx for update nowati . Then execute the DELETE and INSERT statements.

The function is as follows:

partition_table_concurrently(relation_REGCLASS, -- The OID of the primary table. batch_size INTEGER DEFAULT 1000, -- The number of records to copy from the primary table at a time. sleep_time FLOAT8 DEFAULT 1.0) -- The time interval between migration attempts if one or more rows in the batch are locked by other queries. pg_pathman waits for the specified time and tries again up to 60 times before quitting

Example:

```
(1 row)
```

To stop the migration task, call the following function:

stop_concurrent_part_task(relation REGCLASS)

View the background data migration task.

```
postgres=# select * from pathman_concurrent_part_tasks;
userid | pid | dbid | relid | processed | status
-------(0 rows)
```

4. Split range partitions

If a partition is too large and you want to split the partition into two partitions, use the following method (only range partitions are supported):

split_range_partition(partition REGCLASS, -- The OID of the partition. split_value ANYELEMENT, -- The split value.

partition_name TEXT DEFAULT NULL) -- The name of the new partition.

Example:

postgres=# \d+ part_test
Table "public.part_test" Column Type Modifiers Storage Stats target Description
<pre></pre>
postgres=# \d+ part_test_1 Table "public.part_test_1" Column Type Modifiers Storage Stats target Description
<pre>+ id integer plain info text extended crt_time timestamp without time zone not null plain Check constraints: "pathman_part_test_1_3_check" CHECK (crt_time >= '2016-10-25 00:00:00':: timestamp without time zone AND crt_time < '2016-11-25 00:00:00'::timestamp without time zone) Inherits: part_test</pre>
Splitting
postgres=# select split_range_partition('part_test_1'::regclass, The OID of the partition. '2016-11-10 00:00:00'::timestamp, The split value. 'part_test_1_2'); The name of the partitioned table. split_range_partition

split_range_partition

{"2016-10-25 00:00:00","2016-11-25 00:00:00"}

(1 row)

Two tables that are created from splitting are as follows:

postgres=# \d+ part test 1 Table "public.part_test_1" Type Modifiers | Storage | Stats target | Description Column | ----+---+----id |integer | |plain | info |text | |extended| crt_time | timestamp without time zone | not null | plain | Ι Check constraints: "pathman_part_test_1_3_check" CHECK (crt_time >= '2016-10-25 00:00:00':: timestamp without time zone AND crt_time < '2016-11-10 00:00:00'::timestamp without time zone) Inherits: part test postgres=# \d+ part_test_1_2 Table "public.part_test_1_2" Column | Type | Modifiers | Storage | Stats target | Description +---id |integer | |plain | info |text | |extended| crt_time | timestamp without time zone | not null | plain | Check constraints: "pathman_part_test_1_2_3_check" CHECK (crt_time >= '2016-11-10 00:00:00':: timestamp without time zone AND crt time < '2016-11-25 00:00:00'::timestamp without time zone) Inherits: part test

Data is automatically migrated to the other partition.

```
postgres=# select count(*) from part_test_1;
count
------
373
(1 row)
postgres=# select count(*) from part_test_1_2;
count
------
360
(1 row)
```

The inheritance relationship is as follows:

postgres=	# \d+ part_test		
Column	Type	public.part_test" Modifiers Storage Stats target Description	
+			
id int	eger	plain	
info te	xť	extended	
		out time zone not null plain	
Child table	es: part_test_1,		
ра	rt_test_10,		
ра	rt_test_11,		
	rt_test_12,		
pa	irt test 13,		

part_test_14, part_test_15, part_test_16, part_test_17, part_test_18, part_test_19, part_test_1_2, part_test_2, part_test_20, part_test_22, part_test_22, part_test_23, part_test_24, part_test_3, part_test_3, part_test_4, part_test_5, part_test_5, part_test_6, part_test_7, part_test 8,	The added table.
• *	
part test 9	

5. Merge range partitions

Only range partitions are supported. Call the following function:

Specify two partitions to be merged, which must be adjacent partitions. merge_range_partitions(partition1 REGCLASS, partition2 REGCLASS)

Example:

postgres=# select merge_range_partitions('part_test_2'::regclass, 'part_test_12':: regclass) ; ERROR: merge failed, partitions must be adjacent CONTEXT: PL/pgSQL function merge_range_partitions_internal(regclass,regclass, regclass,anyelement) line 27 at RAISE SQL statement "SELECT public.merge_range_partitions_internal(\$1, \$2, \$3, NULL:: timestamp without time zone)" PL/pgSQL function merge_range_partitions(regclass,regclass) line 44 at EXECUTE An error is returned because the partitions are not adjacent.

Adjacent partitions can be merged. postgres=# select merge_range_partitions('part_test_1'::regclass, 'part_test_1_2':: regclass); merge_range_partitions

(1 row)

After the merge is completed, one of the partitions are deleted.

```
"pathman_part_test_1_3_check" CHECK (crt_time >= '2016-10-25 00:00:00'::
timestamp without time zone AND crt_time < '2016-11-25 00:00:00'::timestamp
without time zone)
Inherits: part_test
postgres=# select count(*) from part_test_1;
count
------
733
(1 row)
```

6. Add a range partition following the last partition

There are several methods to add partitions for primary tables that have been previously partitioned. One method is to add partitions following the last partition.

When a new partition is added, the interval of the previously partitioned table will be used. You can query the interval of each partitioned table when it is created for the first time by running the pathman config command:

Add a new range partition (the tablespace cannot be specified).

```
append_range_partition(parent REGCLASS, -- The OID of the primary table.
partition_name TEXT DEFAULT NULL, -- (Optional) The name of the new
partition. Default value: null.
tablespace TEXT DEFAULT NULL) -- (Optional) The tablespace where
the new partition is stored. Default value: null.
```

```
postgres=# select append_range_partition('part_test'::regclass);
append_range_partition
public.part_test_25
(1 row)
postgres=# \d+ part_test_25
                Table "public.part_test_25"
               Type | Modifiers | Storage | Stats target | Description
Column |
----+-
                          +-----
                       ¢
id |integer
info |text
                             |plain |
                            | extended |
crt time | timestamp without time zone | not null | plain |
                                                             I
Check constraints:
  "pathman part test 25 3 check" CHECK (crt time >= '2018-10-25 00:00:00'::
timestamp without time zone AND crt time < '2018-11-25 00:00:00'::timestamp
without time zone)
Inherits: part test
postgres=# \d+ part_test_24
                Table "public.part_test_24"
```

Column | Type | Modifiers | Storage | Stats target | Description ----+--_____ | integer |plain | id I info |text Ľ | extended | crt_time | timestamp without time zone | not null | plain | Check constraints: "pathman_part_test_24_3_check" CHECK (crt_time >= '2018-09-25 00:00:00':: timestamp without time zone AND crt_time < '2018-10-25 00:00:00'::timestamp without time zone) Inherits: part_test

7. Add a range partition at the beginning of partitions

Add a partition at the beginning of the partitions. The function is as follows:

prepend_range_partition(parent REGCLASS, partition_name TEXT DEFAULT NULL, tablespace TEXT DEFAULT NULL)

Example:

postgres=# select prepend_range_partition('part_test'::regclass); prepend_range_partition		
public.part_test_26 (1 row)		
postgres=# \d+ part_test_26 Table "public.part_test_26" Column Type Modifiers Storage Stats target Description		
+ id integer plain info text extended crt_time timestamp without time zone not null plain Check constraints: "pathman_part_test_26_3_check" CHECK (crt_time >= '2016-09-25 00:00:00':: timestamp without time zone AND crt_time < '2016-10-25 00:00:00'::timestamp without time zone) Inherits: part_test		
postgres=# \d+ part_test_1 Table "public.part_test_1" Column Type Modifiers Storage Stats target Description		
<pre>id integer plain info text extended crt_time timestamp without time zone not null plain Check constraints: "pathman_part_test_1_3_check" CHECK (crt_time >= '2016-10-25 00:00:00':: timestamp without time zone AND crt_time < '2016-11-25 00:00:00'::timestamp without time zone) Inherits: part test</pre>		

8. Add a partition

You can create new partitions by specifying the start value of the partitions. New partitions can be created if the ranges do not overlap with existing partitions. This

method allows you to create non-continuous partitions. For example, if the range of existing partitions are from 2010 to 2015, you can create a new partition from 2020. You do not need to create a partition between 2015 and 2020. The function is as follows:

```
add_range_partition(relation REGCLASS, -- The OID of the primary table.
start_value ANYELEMENT, -- The start value.
end_value ANYELEMENT, -- The end value.
partition_name TEXT DEFAULT NULL, -- The name of the partition.
tablespace TEXT DEFAULT NULL) -- The name of the tablespace in which a
partition resides.
```

Example:

```
postgres=# select add range partition('part test'::regclass, -- The OID of the
primary table.
          '2020-01-01 00:00:00'::timestamp, -- The start value.
          '2020-02-01 00:00:00'::timestamp); -- The end value.
add range partition
public.part_test_27
(1 row)
postgres=# \d+ part test 27
                Table "public.part test 27"
                      | Modifiers | Storage | Stats target | Description
 Column |
               Type
----+
                           +-----
id |integer
info |text
                       | plain |
                       Ľ
                           | extended |
crt time | timestamp without time zone | not null | plain |
                                                             Ι
Check constraints:
  "pathman_part_test_27_3_check" CHECK (crt_time >= '2020-01-01 00:00:00'::
timestamp without time zone AND crt_time < '2020-02-01 00:00:00'::timestamp
without time zone)
Inherits: part test
```

9. Delete a partition

To delete a single partition range, call the following function:

drop_range_partition(partition TEXT, -- The name of the partition to be deleted. delete_data BOOLEAN DEFAULT TRUE) -- Specifies whether to delete the data of the partition. If you set the value to FALSE, the data of the partition is migrated to the primary table.

Drop RANGE partition and all of its data if delete_data is true.

Example:

```
Delete a partition and migrate data of the partition to the primary table.
postgres=# select drop_range_partition('part_test_1',false);
NOTICE: 733 rows copied from part_test_1
drop_range_partition
-------
part_test_1
(1 row)
```

postgres=# select drop_range_partition('part_test_2',false);

NOTICE: 720 rows copied from part test 2 drop_range_partition part test 2 (1 row) postgres=# select count(*) from part_test; count 10000 (1 row) Delete a partition and the data of the partition without migrating the data to the primary table. postgres=# select drop_range_partition('part_test_3',true); drop_range_partition part_test_3 (1 row) postgres=# select count(*) from part_test; count 9256 (1 row) postgres=# select count(*) from only part_test; count 1453 (1 row)

Delete all partitions and specify whether to migrate data to the primary table. The

function is as follows:

```
drop_partitions(parent REGCLASS,
delete_data BOOLEAN DEFAULT FALSE)
```

Drop partitions of the parent table (both foreign and local relations). If delete_data is false, the data is copied to the parent table first. Default is false.

```
postgres=# select drop_partitions('part_test'::regclass, false); -- Delete all partitions
and migrate the data to the primary table.
NOTICE: function public.part_test_upd_trig_func() does not exist, skipping
NOTICE: 744 rows copied from part_test_4

NOTICE: 0 rows copied from part_test_18 NOTICE: 0 rows copied from part_test_19 NOTICE: 0 rows copied from part_test_20 NOTICE: 0 rows copied from part_test_21 NOTICE: 0 rows copied from part_test_22 NOTICE: 0 rows copied from part_test_23 NOTICE: 0 rows copied from part_test_24 NOTICE: 0 rows copied from part_test_25 NOTICE: 0 rows copied from part_test_26 NOTICE: 0 rows copied from part_test_27 drop_partitions	
24 (1 row)	
postgres=# select count(*) from part_test; count 9256 (1 row)	
postgres=# \dt part_test_4 No matching relations found.	

10.Attach a table to a partitioned table

Attach a table to a partitioned primary table. The table must have the same schema

as the primary table, including the dropped columns (check the consistency of

pg_attribute). The function is as follows:

attach_range_partition(relation REGCLASS, -- The OID of the primary table. partition REGCLASS, -- The OID of the partition table. start_value ANYELEMENT, -- The start value. end_value ANYELEMENT) -- The start value.

postgres=# create table part_test_1 (like part_test including all); CREATE TABLE postgres=# \d+ part_test Table "public.part_test"
Column Type Modifiers Storage Stats target Description
id integer plain info text extended crt_time timestamp without time zone not null plain
postgres=# \d+ part_test_1 Table "public.part_test_1" Column Type Modifiers Storage Stats target Description
id integer plain info text extended crt_time timestamp without time zone not null plain
postgres=# select attach_range_partition('part_test'::regclass, 'part_test_1'::regclass, '2019-01-01 00:00:00'::timestamp, '2019-02-01 00:00:00'::timestamp); attach_range_partition

-----part test 1 (1 row)When the table is attached, inheritance relationships and constraints are created automatically. postgres=# \d+ part_test_1 Table "public.part_test_1" Туре | Modifiers | Storage | Stats target | Description Column | ----+-------+---+----+-----+-----+---**+**----id |integer info |text |plain | | extended | crt_time | timestamp without time zone | not null | plain | Check constraints: 'pathman_part_test_1_3_check" CHECK (crt_time >= '2019-01-01 00:00:00':: timestamp without time zone AND crt_time < '2019-02-01 00:00:00'::timestamp without time zone) Inherits: part_test

11.Detach a partition from the primary table (convert the partition into a normal table)

Delete a partition from the primary table inheritance. The data is not deleted. The

inheritance and constraints are deleted. The function is as follows:

detach_range_partition(partition REGCLASS) -- Specify the name of the partition and convert the partition to a normal table.

Example:

postgres=# select count(*) from part_test; count 9256 (1 row) postgres=# select count(*) from part_test_2; count 733 (1 row) postgres=# select detach_range_partition('part_test_2'); detach_range_partition part_test_2 (1 row) postgres=# select count(*) from part test 2; count 733 (1 row) postgres=# select count(*) from part test; count _____ 8523

(1 row)

12.Permanently disable the pg_pathman plug-in for a partitioned table

You can disable the pg_pathman plug-in for a single partitioned primary table. The

function is as follows:

disable_pathman_for(relation TEXT)

Permanently disable pg_pathman partitioning mechanism for the specified parent table and remove the insert trigger if it exists. All partitions and data remain unchanged.

postgres=# \sf disable_pathman_for CREATE OR REPLACE FUNCTION public.disable_pathman_for(parent_relid regclass) RETURNS void LANGUAGE plpgsql STRICT AS \$function\$ BEGIN PERFORM public.validate_relname(parent_relid); DELETE FROM public.pathman_config WHERE partrel = parent_relid; PERFORM public.drop_triggers(parent_relid);

/* Notify backend about changes */
 PERFORM public.on_remove_partitions(parent_relid);
END
\$function\$

```
postgres=# select disable_pathman_for('part_test');

Inherits: part_test

After the pg_pathman plug-in is disabled, the inheritance and constraints remain

unchanged. The pg_pathman plug-in does not intervene in the custom scan execution

```
plan. The execution plan after the pg_pathman plug-in is disabled:
```

postgres=# explain select * from part_test where crt_time='2017-06-25 00:00:00'::
timestamp;

QUERY PLAN

```
Append (cost=0.00..16.00 rows=2 width=45)
-> Seq Scan on part_test (cost=0.00..0.00 rows=1 width=45)
Filter: (crt_time = '2017-06-25 00:00'::timestamp without time zone)
-> Seq Scan on part_test_10 (cost=0.00..16.00 rows=1 width=45)
Filter: (crt_time = '2017-06-25 00:00:00'::timestamp without time zone)
(5 rows)
```

Notice:

The disable_pathman_for operation is irreversible. Proceed with caution.

Advanced partition management

1. Disable a primary table

After all data of a primary table is migrated to the partitions, you can disable the

primary table. The function is as follows:

set_enable_parent(relation REGCLASS, value BOOLEAN)

Include/exclude parent table into/from query plan.

In original PostgreSQL planner parent table is always included into query plan even if it's empty which can lead to additional overhead.

You can use disable_parent() if you are never going to use parent table as a storage.

Default value depends on the partition_data parameter that was specified during initial partitioning in create_range_partitions() or create_partitions_from_range() functions.

If the partition_data parameter was true then all data have already been migrated to partitions and parent table disabled.

Otherwise it is enabled.

Example:

select set_enable_parent('part_test', false);

2. Auto partition propagation

Auto partition propagation is supported for range partitioned tables. If the inserted data is not within the range of the existing partitions, a partition is automatically created.

set_auto(relation REGCLASS, value BOOLEAN)

Enable/disable auto partition propagation (only for RANGE partitioning).

It is enabled by default.

postgres=# \d+ part_test Table "public.part_test" Column Type Modifiers Storage Stats target Description
<pre>ind integer plain info text extended crt_time timestamp without time zone not null plain Child tables: part_test_10, part_test_11, part_test_12, part_test_13, part_test_14, part_test_16, part_test_16, part_test_18, part_test_20, part_test_21, part_test_21, part_test_23, part_test_23, part_test_25, part_test_26, part_test_5, part_test_6, part_test_9</pre>

Note:

We recommend that you disable auto partition propagation for range partitioning because inappropriate auto propagation may consume a lot of time.

3. Callback functions that are triggered for each partition creation

A callback function is a function that is automatically triggered for each partition creation. For example, a callback function can record the DDL statements that you use to run logical replication and store the statements in a table. The callback function is as follows:

set_init_callback(relation REGCLASS, callback REGPROC DEFAULT 0)

Set partition creation callback to be invoked for each attached or created partition (both HASH and RANGE).

The callback must have the following signature:

part_init_callback(args JSONB) RETURNS VOID.

Parameter arg consists of several fields whose presence depends on partitioning type:

```
/* RANGE-partitioned table abc (child abc_4) */
{
    "parent": "abc",
    "parttype": "2",
    "partition": "abc_4",
    "range_max": "401",
    "range_min": "301"
}
/* HASH-partitioned table abc (child abc_0) */
{
    "parent": "abc",
    "parttype": "1",
    "partition": "abc_0"
}
```

```
Callback function
postgres=# create or replace function f_callback_test(jsonb) returns void as
$$
declare
begin
 create table if not exists rec part ddl(id serial primary key, parent name, parttype int
, partition name, range_max text, range_min text);
 if ($1->>'parttype')::int = 1 then
  raise notice 'parent: %, parttype: %, partition: %', $1->>'parent', $1->>'parttype', $1-
>>'partition';
  insert into rec part ddl(parent, parttype, partition) values (($1->>'parent')::name,
(\$1->>'parttype')::int, (\$1->>'partition')::name);
 elsif ($1->>'parttype')::int = 2 then
  raise notice 'parent: %, parttype: %, partition: %, range_max: %, range_min: %', $1-
>>'parent', $1->>'parttype', $1->>'partition', $1->>'range_max', $1->>'range_min';
  insert into rec_part_ddl(parent, parttype, partition, range_max, range_min) values
(($1->>'parent')::name, ($1->>'parttype')::int, ($1->>'partition')::name, $1->>'
range max', $1->>'range min');
end if;
end:
$$ language plpgsgl strict;

19.3 Enable the zhparser plug-in

This topic describes how to enable the zhparser plug-in and customize a Chinese word

segment dictionary in PolarDB-P.

Enable the zhparser plug-in

Execute the following statements to enable the zhparser plug-in:

CREATE EXTENSION zhparser; CREATE TEXT SEARCH CONFIGURATION testzhcfg (PARSER = zhparser); ALTER TEXT SEARCH CONFIGURATION testzhcfg ADD MAPPING FOR n,v,a,i,e,l WITH simple; --Optional parameter configuration alter role all set zhparser.multi_short=on; --Perform a simple test SELECT * FROM ts_parse('zhparser', 'hello world! 2010年保障房建设在全国范围内获全面启 动,从中央到地方纷纷加大了保障房的建设和投入力度。2011年,保障房进入了更大规 模的建设阶段。住房城乡建设部党组书记、部长姜伟新去年底在全国住房城乡建设工作会议上表 示,要继续推进保障性安居工程建设。'); SELECT to_tsvector('testzhcfg'; "今年保障房新开工数量虽然有所下调,但实际的年度在建规模 以及竣工规模会超以往年份,相对应的对资金的需求也会创历史纪录。"陈国强说。在他看来, 与2011年相比,2012年的保障房建设在资金配套上的压力将更为严峻。'); SELECT to_tsquery('testzhcfg', '保障房资金压力');

Execute the following statements to use the zhparser plug-in to run a full-text index:

--Create a full-text index for the name field of table T1 create index idx_t1 on t1 using gin (to_tsvector('zhcfg',upper(name))); --Use the full-text index select * from t1 where to_tsvector('zhcfg',upper(t1.name)) @@ to_tsquery('zhcfg','(防 火)');

Customize a Chinese word segment dictionary

Execute the following statements to customize a Chinese word segment dictionary

-- The segmentation result SELECT to_tsquery('testzhcfg', '保障房资金压力'); -- Insert a new word segment to the dictionary insert into pg_ts_custom_word values ('保障房资'); -- Make the inserted word segment take effect select zhprs_sync_dict_xdb(); -- End the connection \c -- Requery to obtain new segmentation results SELECT to_tsquery('testzhcfg', '保障房资金压力');

Instructions to use custom word segments:

- A maximum of 1 million custom word segments can be added. If the number of word segments exceed the limit, the word segments outside the limit are not processed.
 Ensure that the number of word segments is within this range. The custom and default word segmentation dictionaries take effect at the same time.
- Each word segment can be a maximum of 128 bytes in length. The section after the 128th byte will be truncated.

20 Error codes

This topic describes error codes of PolarDB-P.

Error codes format

Each error message sent by PolarDB-P is assigned an error code with five characters. All error messages comply with the standard conventions of SQL on the SQLSTATE code. If you need to determine what type of error that the application has received, you can check the error code or the text of the returned message. The error text may vary from version to version, but the error code does not change.

Based on the SQL standards, the first two digits of the error code indicate the error class, and the last three digits indicate a specific situation under the current error class. Even if an application cannot identify a specific error code, the application can identify the error class from the first two digits of the error code.

The following table lists all error classes and error codes. For each error class, the system specifies one error code whose last three digits are 000. This error code indicates no error occurs for specific situations in the current error class.

Error codes

Note:

Condition Name specifies the condition name that can be used in stored procedures. Condition names are not case sensitive.

Stored procedures cannot identify condition names of the warning type. The correspond ing error classes are 00, 01, and 02.

Table 20-1: Class 00 - Successful completion

Error Code	Condition Name
00000	successful_completion

Table 20-2: Class 01 - Warning

Error Code	Condition Name
01000	warning
0100C	dynamic_result_sets_returned

Error Code	Condition Name
01008	implicit_zero_bit_padding
01003	null_value_eliminated_in_set_function
01007	privilege_not_granted
01006	privilege_not_revoked
01004	string_data_right_truncation
01P01	deprecated_feature

Table 20-3: Class 02 - No data. This is also a warning class per the SQL standard.

Error Code	Condition Name
02000	no_data
02001	no_additional_dynamic_result_sets_returned

Table 20-4: Class 03 - SQL statement not yet complete

Error Code	Condition Name
03000	sql_statement_not_yet_complete

Table 20-5: Class 08 - Connection exception

Error Code	Condition Name
08000	connection_exception
08003	connection_does_not_exist
08006	connection_failure
08001	sqlclient_unable_to_establish_sqlconnection
08004	sqlserver_rejected_establishment_of_sqlconnection
08007	transaction_resolution_unknown
08P01	protocol_violation

Table 20-6: Class 09 - Triggered action exception

Error Code	Condition Name
09000	triggered_action_exception

Table 20-7: Class 0A - Feature not supported

Error Code	Condition Name
0A000	feature_not_supported

Table 20-8: Class 0B - Invalid transaction initiation

Error Code	Condition Name
0B000	invalid_transaction_initiation

Table 20-9: Class 0F - Locator exception

Error Code	Condition Name
0F000	locator_exception
0F001	invalid_locator_specification

Table 20-10: Class 0L - Invalid grantor

Error Code	Condition Name
0L000	invalid_grantor
0LP01	invalid_grant_operation

Table 20-11: Class 0P - Invalid role specification

Error Code	Condition Name
0P000	invalid_role_specification

Table 20-12: Class 0Z - Diagnostics exception

Error Code	Condition Name
0Z000	diagnostics_exception
0Z002	stacked_diagnostics_accessed_without_active_handler

Table 20-13: Class 20 - Case not found

Error Code	Condition Name
20000	case_not_found

Table 20-14: Class 21 - Cardinality violation

Error Code	Condition Name
21000	cardinality_violation

Table 20-15: Class 22 - Data exception

Error Code	Condition Name
22000	data_exception
2202E	array_subscript_error
22021	character_not_in_repertoire
22008	datetime_field_overflow
22012	division_by_zero
22005	error_in_assignment
2200B	escape_character_conflict
22022	indicator_overflow
22015	interval_field_overflow
2201E	invalid_argument_for_logarithm
22014	invalid_argument_for_ntile_function
22016	invalid_argument_for_nth_value_function
2201F	invalid_argument_for_power_function
2201G	invalid_argument_for_width_bucket_function
22018	invalid_character_value_for_cast
22007	invalid_datetime_format
22019	invalid_escape_character
2200D	invalid_escape_octet
22025	invalid_escape_sequence
22P06	nonstandard_use_of_escape_character
22010	invalid_indicator_parameter_value
22023	invalid_parameter_value
22013	invalid_preceding_or_following_size
2201B	invalid_regular_expression
2201W	invalid_row_count_in_limit_clause

Error Code	Condition Name
2201X	invalid_row_count_in_result_offset_clause
2202Н	invalid_tablesample_argument
2202G	invalid_tablesample_repeat
22009	invalid_time_zone_displacement_value
2200C	invalid_use_of_escape_character
2200G	most_specific_type_mismatch
22004	null_value_not_allowed
22002	null_value_no_indicator_parameter
22003	numeric_value_out_of_range
2200Н	sequence_generator_limit_exceeded
22026	string_data_length_mismatch
22001	string_data_right_truncation
22011	substring_error
22027	trim_error
22024	unterminated_c_string
2200F	zero_length_character_string
22P01	floating_point_exception
22P02	invalid_text_representation
22P03	invalid_binary_representation
22P04	bad_copy_file_format
22P05	untranslatable_character
2200L	not_an_xml_document
2200M	invalid_xml_document
2200N	invalid_xml_content
22005	invalid_xml_comment
2200T	invalid_xml_processing_instruction

Table 20-16: Class 23 - Integrity constraint violation

Error Code	Condition Name
23000	integrity_constraint_violation

Error Code	Condition Name
23001	restrict_violation
23502	not_null_violation
23503	foreign_key_violation
23505	unique_violation
23514	check_violation
23P01	exclusion_violation

Table 20-17: Class 24 - Invalid cursor state

Error Code	Condition Name
24000	invalid_cursor_state

Table 20-18: Class 25 - Invalid transaction state

Error Code	Condition Name
25000	invalid_transaction_state
25001	active_sql_transaction
25002	branch_transaction_already_active
25008	held_cursor_requires_same_isolation_level
25003	inappropriate_access_mode_for_branch_transaction

XX002	index_corrupted

21 Solutions to frequent errors

This topic describes how to handle PolarDB-P errors.

Connection exceptions

A connection exception refers to the error that occurs when an application or a client connects to the database. For example, after you create a connection, an error message may be returned. This indicates that the connection does not exist, the connection times out, or the client cannot connect to the database instance. Connection exceptions often occur when the network is temporarily disconnected or the database service is restarted. You must make sure that your application can reconnect to the database. This allows you to handle the exceptions for these types of connections. If you still cannot create a connection , .

Data exceptions

Data exceptions refer to the following errors, such as invalid function parameters, incorrect array index, division by zero, invalid data type, and invalid escape characters. You can find the detailed error information based on Error codes and the condition name. To handle a data exception, you need to find the exact SQL statement where the exception occurs based on the error code and message. Then, fix the SQL statement and try again.

Syntax errors

Syntax errors occur in SQL statements when you use undefined columns, functions, tables , or parameters. This also occurs when you create duplicate columns, databases, functions , tables, or aliases. The error messages can show you the exact SQL statement where the exception occurs and the error class. You can fix the issues based on the error messages.

Insufficient resources

In most cases, insufficient resources are caused by out of disk space, out of memory (OOM), too many connections, or excessive usage of specific resources. You can upgrade the instance specification to solve these issues. However, you need to address the issue based on the specific scenario. For example, if an application creates too many connections at a time, the upper limit of connections may be exceeded. Slow queries or shortage of compute resources (such as CPU and memory resources) can also result in a large number of pending connections. We recommend that you reduce the number of connections, or optimize inefficient SQL statements as needed.
